Search On Mobile Application

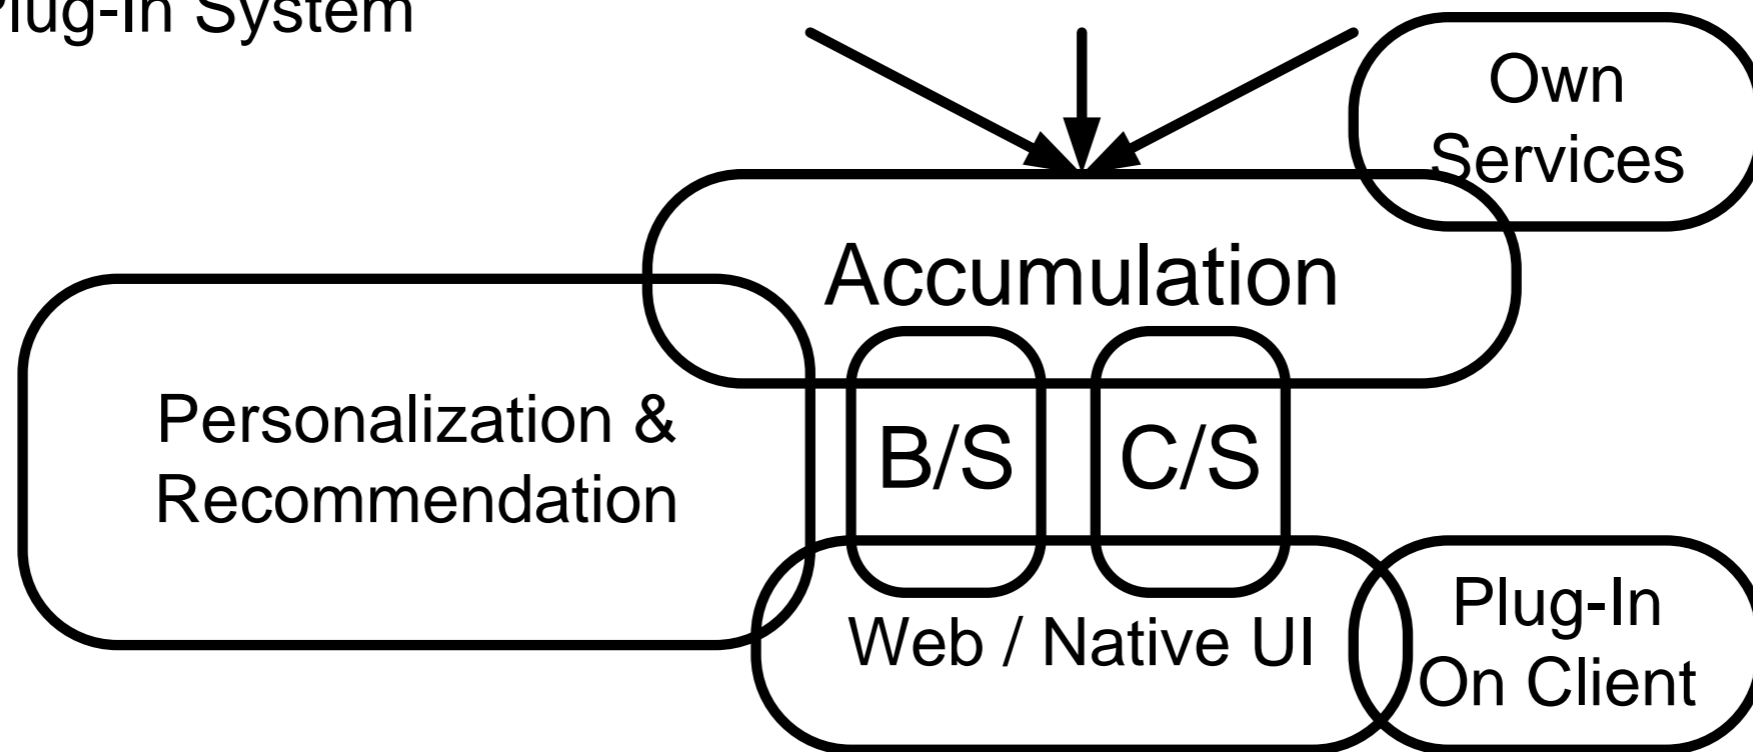

- About Baidu Mobile and Search Application
- The Architecture of Baidu Mobile
- Mobile Search Basic
- Mobile Search Enhancement

The Architecture of Baidu Mobile

The Architecture of Baidu Mobile

- Enhanced Browser and WebApp —— B/S Mode
- Super Client-Server Application —— C/S Mode
- Accumulation of Information and Service
- Personalization And Recommendation
- Client Plug-In System

Enhanced Browser and Web App

Baidu Mobile Application can work as enhanced browser.
There is standard WebApp and special WebApp.

- Supporting standard WebApp.
- Some UI features on Browser
- Additional Web APIs for hybrid
- Search Result Page as Core content
- Special WebApp as Own UI

Novel

Video

CardCenter

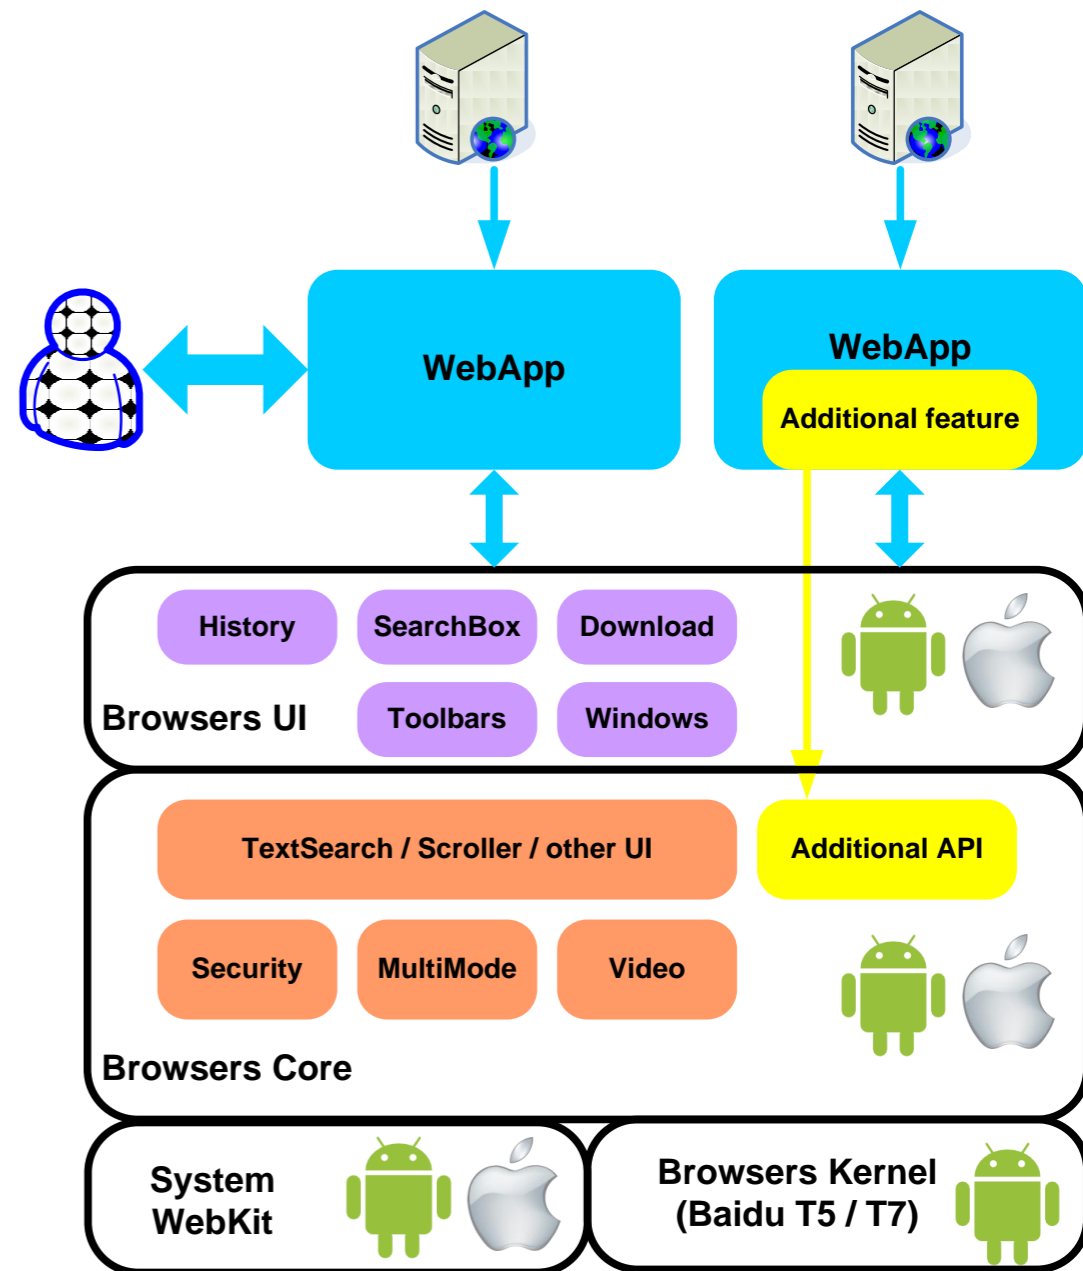

Enhanced Browser and Web App

Browser of Baidu Mobile :

- Baidu T5/T7 Kernel for Android.
- Browsers Core with additional modules
- CloudaJS WebAPI
- Different Browsers UI for different situations

WebApp of Baidu Mobile:

- Search Result Page is optimized.
- Internal WebApp can use additional module to build the application UI.
- Some external O2O WebApp (@) can also use additional WebAPI and run in different UI

Super Client-Server Application

Baidu Mobile is a super application. The main design conception is cross-platform template. Client-Server mode is a basic of UI mechanism of Baidu Mobile.

Performance

Compatibility and Expansibility

Controllability

Super Client-Server Application : Performance

We consider two aspects of Client-Server application:

- Capability of Server (CPU , Memory , IO)
- User Experience (data channel , display speed)

Optimizations Points:

- Server Page Cache => Separate / Force Time / Permutation & Combination
- Asynchronous Loader and Displayer => Image Loader, display sequence
- Request Merging => JSON data , protocol buffer
- Cache Negotiation => Client stores data cache and use the return code ,Server judges both timestamp and data signature

Code

Super Client-Server Application : Compatibility and Expansibility

There is program on Client side and Complex Client Storage. Compatibility and expansibility are core conception of CS Mode application.

- Code policy
 - ◆ Forwards compatible on Client Side
 - ◆ Backward compatible on Server Side
- Cache Policy
 - ◆ Distributed Cache Adjustment
 - ◆ Cache on Client
- Storage Policy
 - ◆ Persistent Storage Optimization
 - ◆ Storage on Client

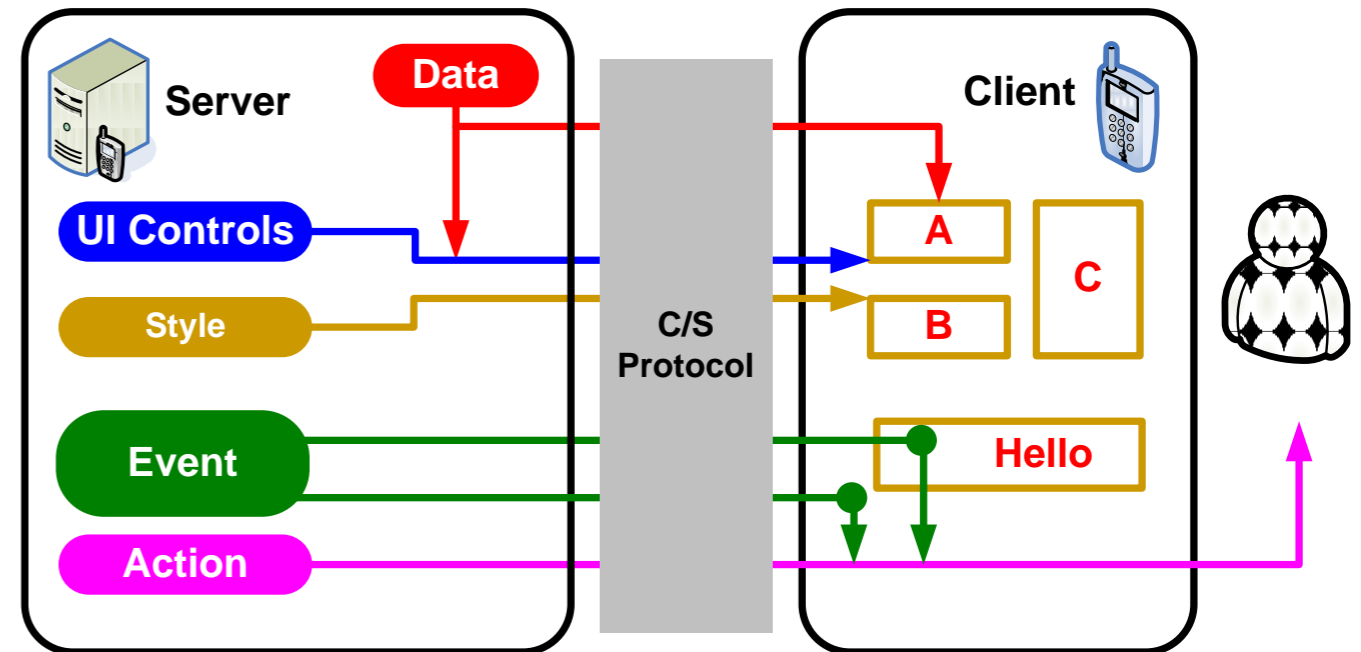

Super Client-Server Application : Controllability

The distribution of Mobile Application is not easy. When we want to update the content to user, the mobile application cannot be updated immediately.

Powerful controllability:

- Several template methods
- Content : Data, UI , Behavior
- 2 sides : Flexibility vs Complexity
- Customer Schema and Browsers ?

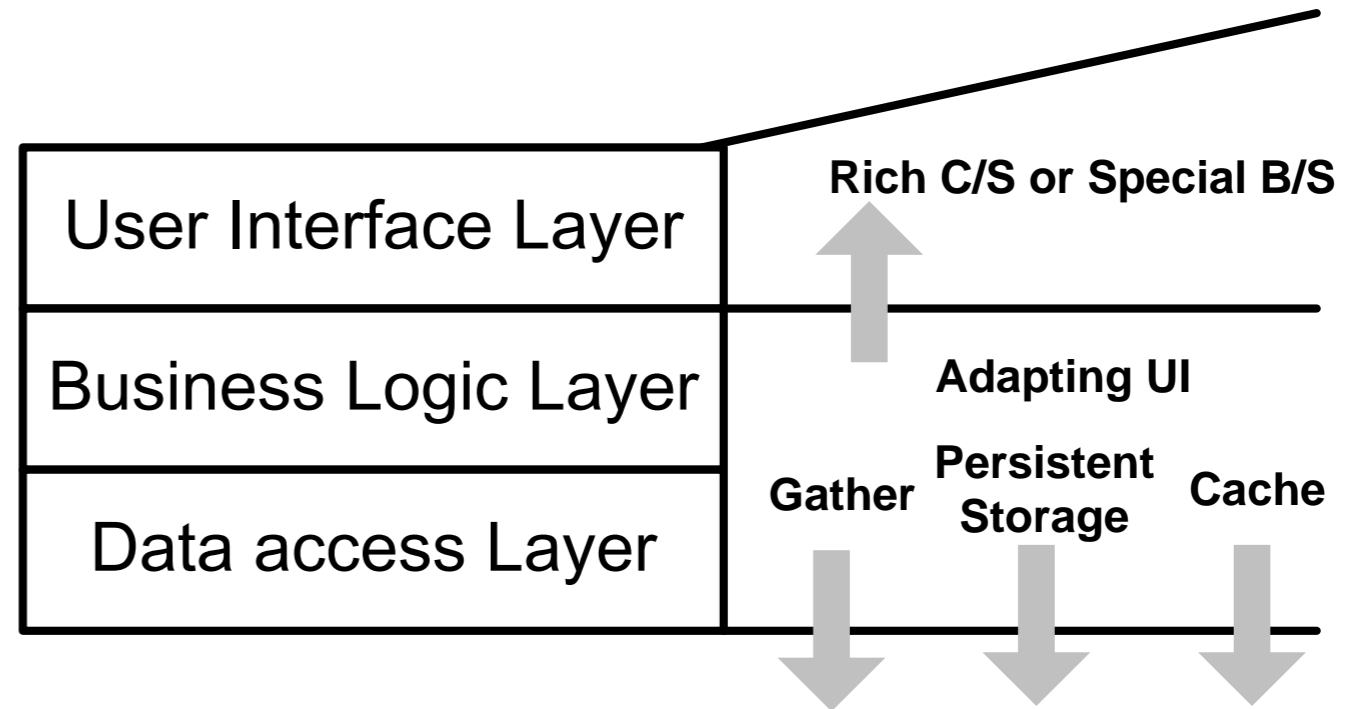

Accumulation of Information and Services

Information and services are from own resource and upstream service.

- Information : news , video , novel , gallery and so on.
- Services: lots of O2O support

The Resource of Baidu Mobile include:

- Multiple high concurrency business
- Resource connectivity center
- O2O business support
- Connecting to the World

Accumulation of Information and Service

Offline System and Storage

Cache System

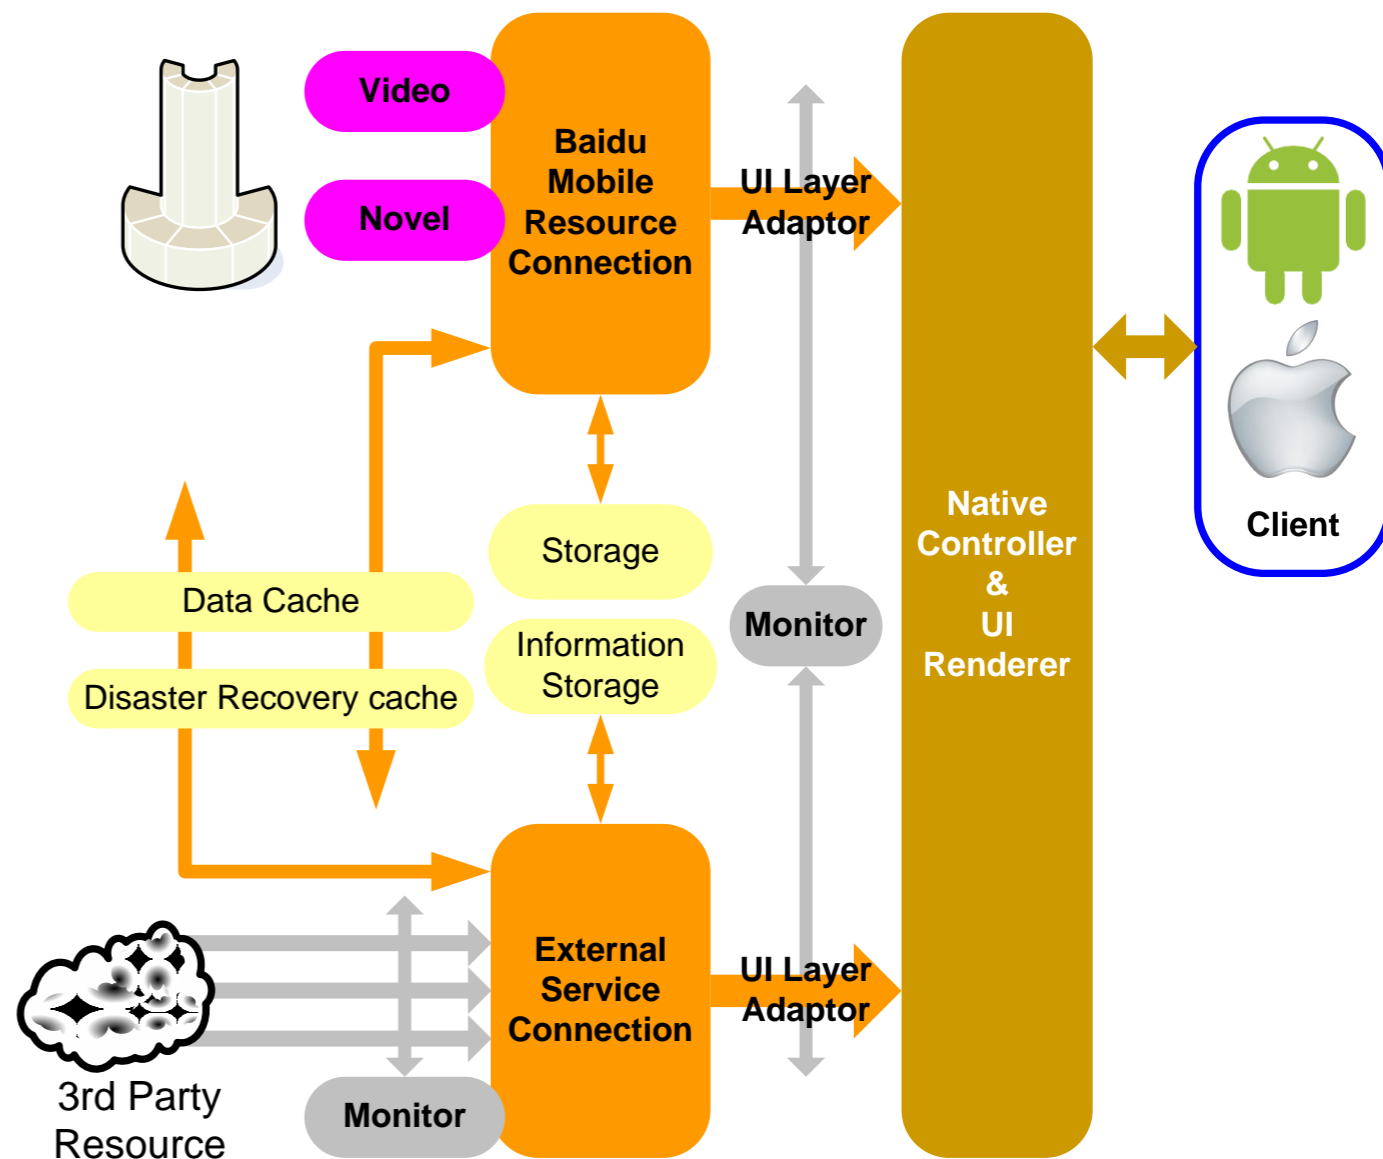

- Data cache
- Disaster Recovery cache

Adapting UI Layer

- Totally Different Resources
- Fill the template
- Abstract the schema

Resource Management

- Resource Switcher and MAP
- Resource Monitor

Personalization And Recommendation

The goal is different services for different users.

The main points are:

- Storage and Management of big data
- Mobile User Profile
- On-line Service And Off-line Data Processor

User Behavior

User Scene

Requirement

Data mining

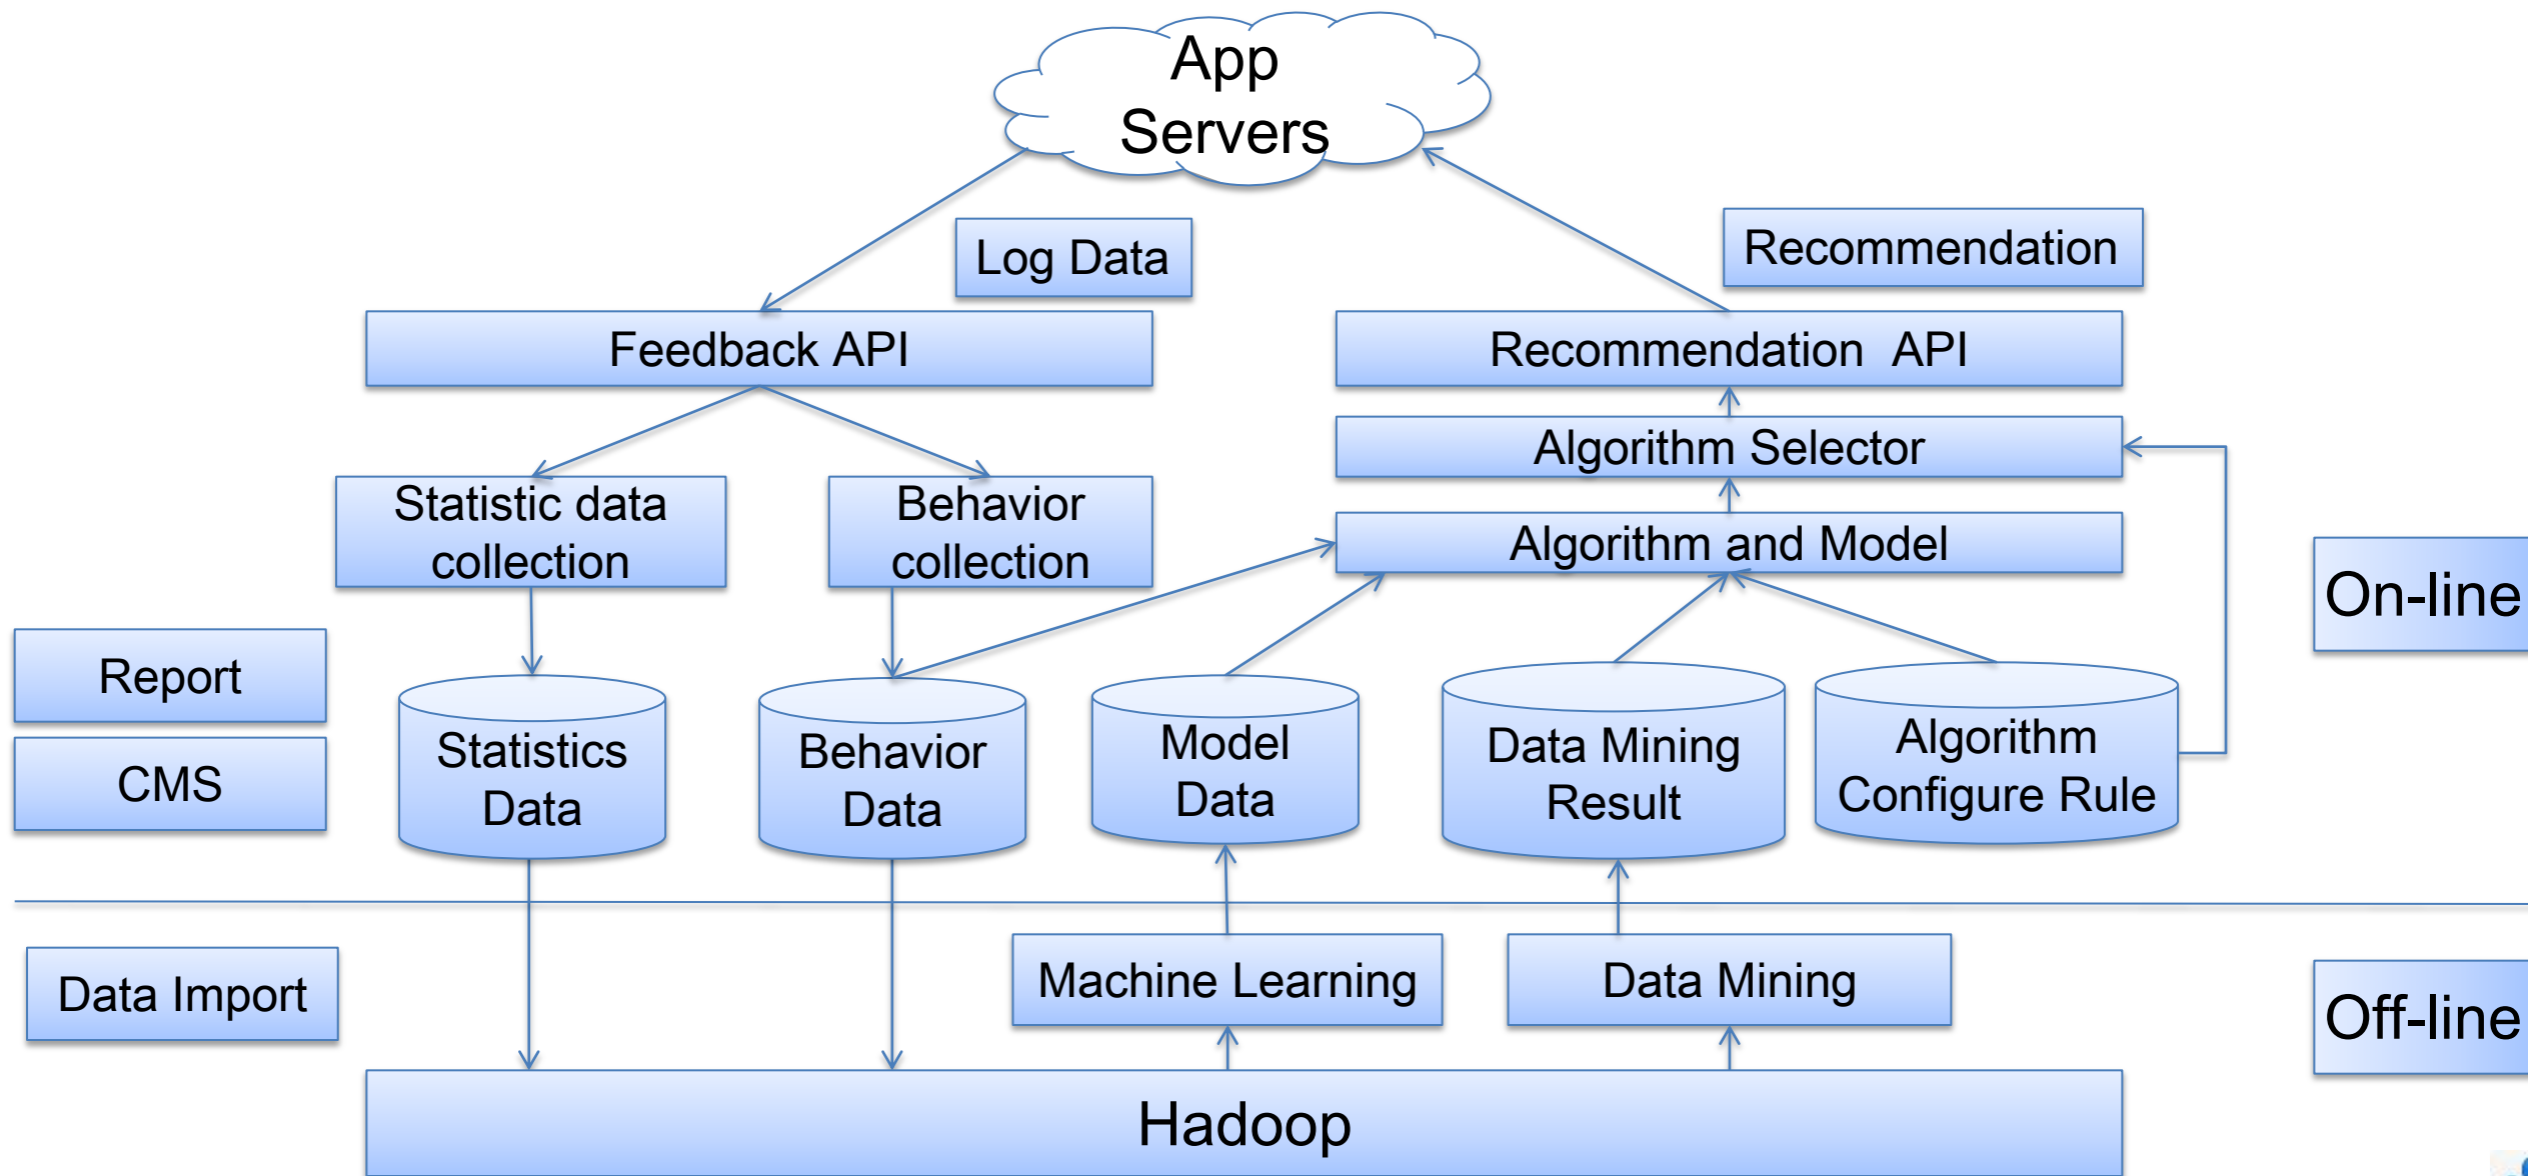

User Profile

Recommendation

Feedback

Optimization

Personalization And Recommendation

Client Plug-in System

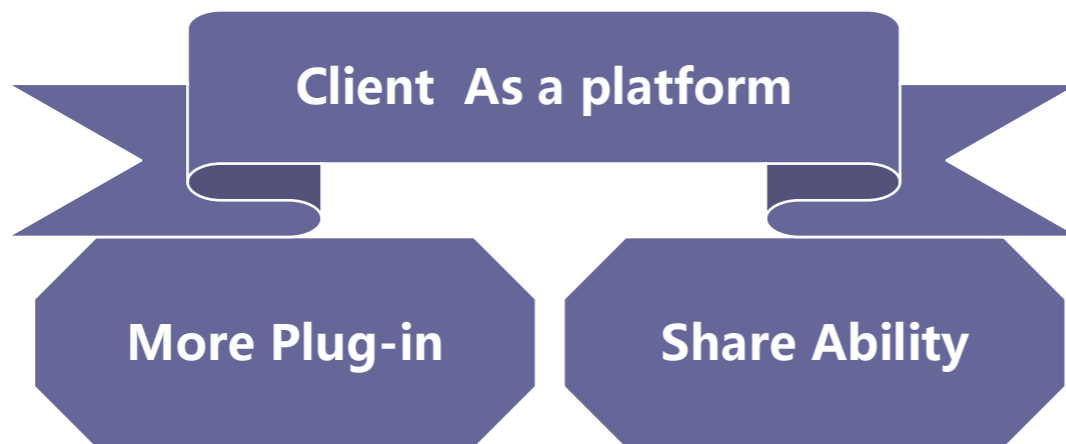

Client Plug-in System make Baidu Mobile have multiple functions.

Plug-in feature:

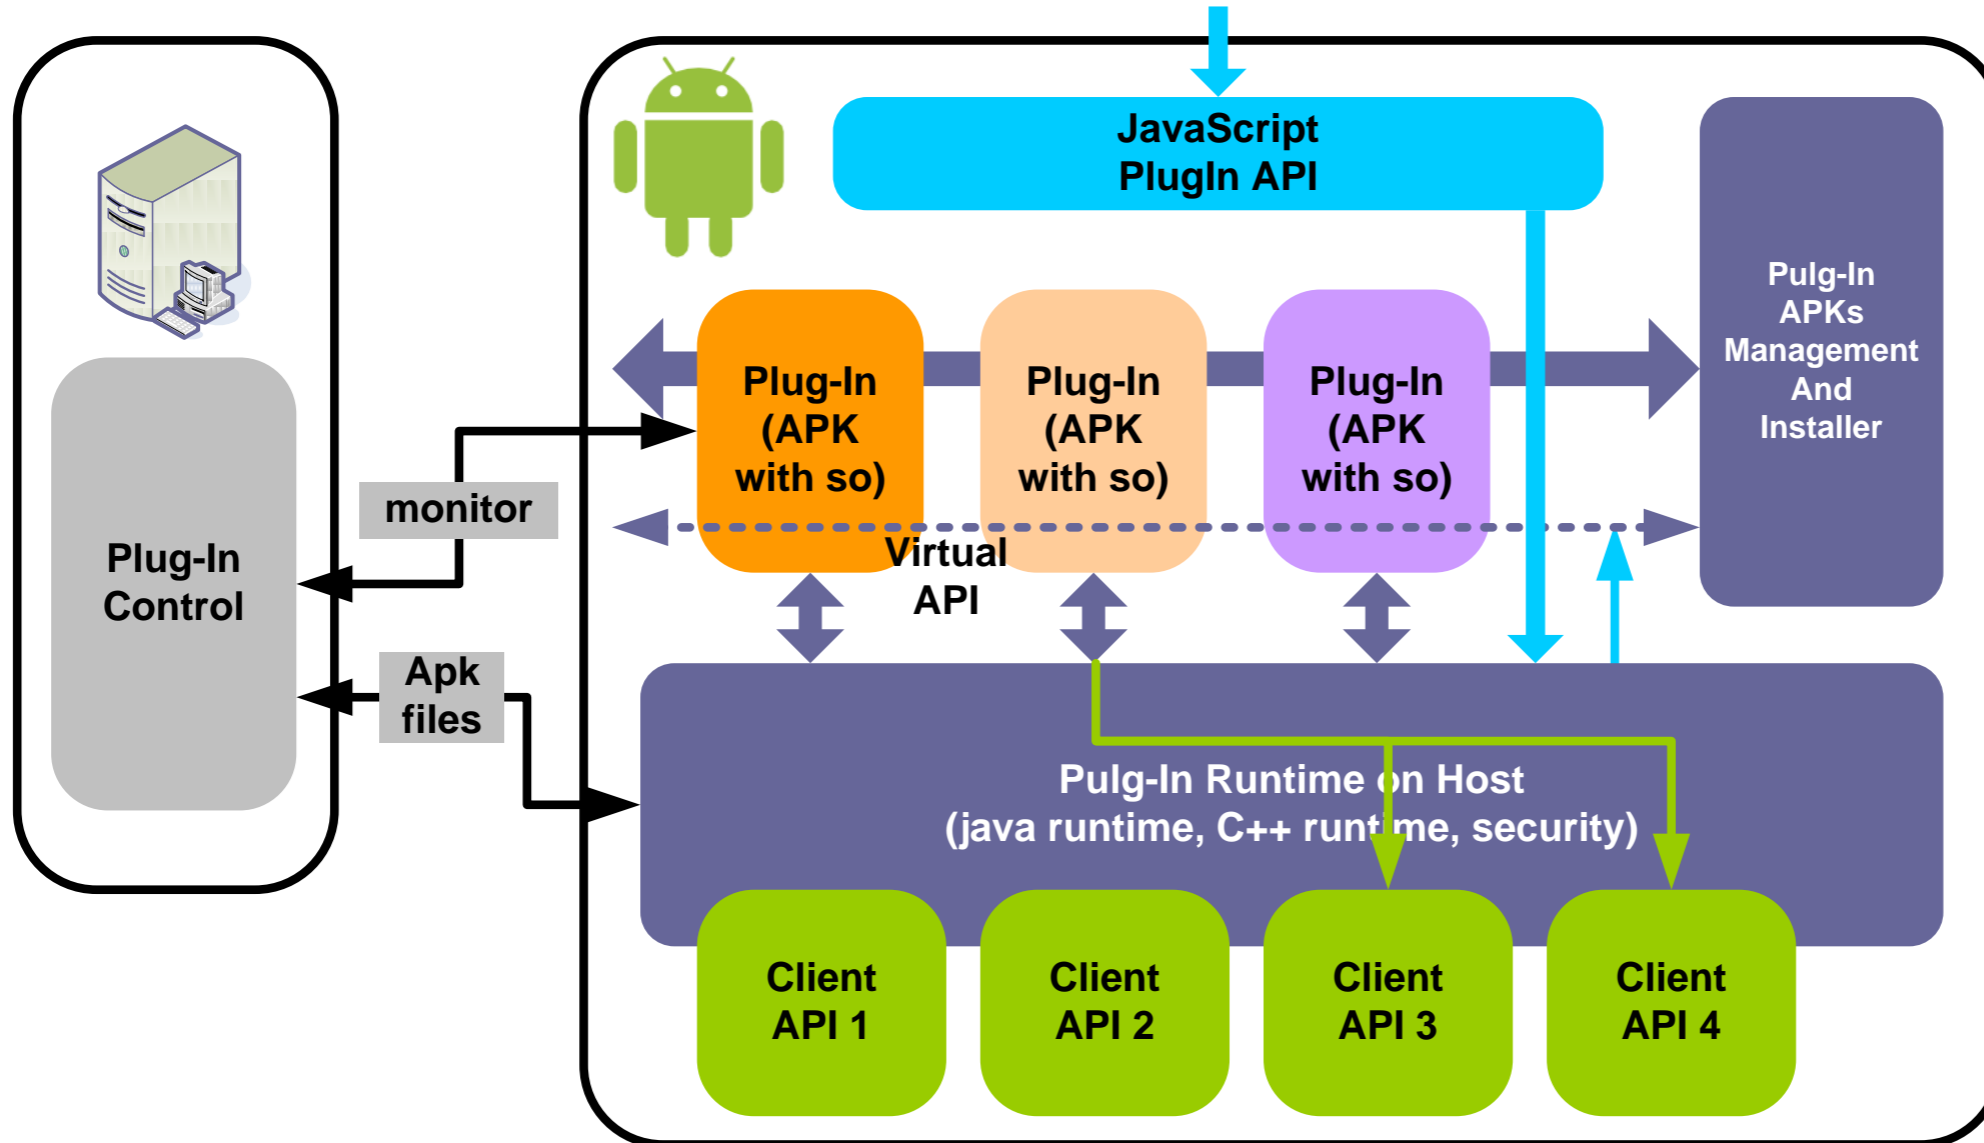

- Dynamic and Static Plug-in
- Common Host API for Plug-Ins
- Virtual API between Plug-Ins
- JavaScript PlugIn API for WebApp

Some capabilities for PlugIn:

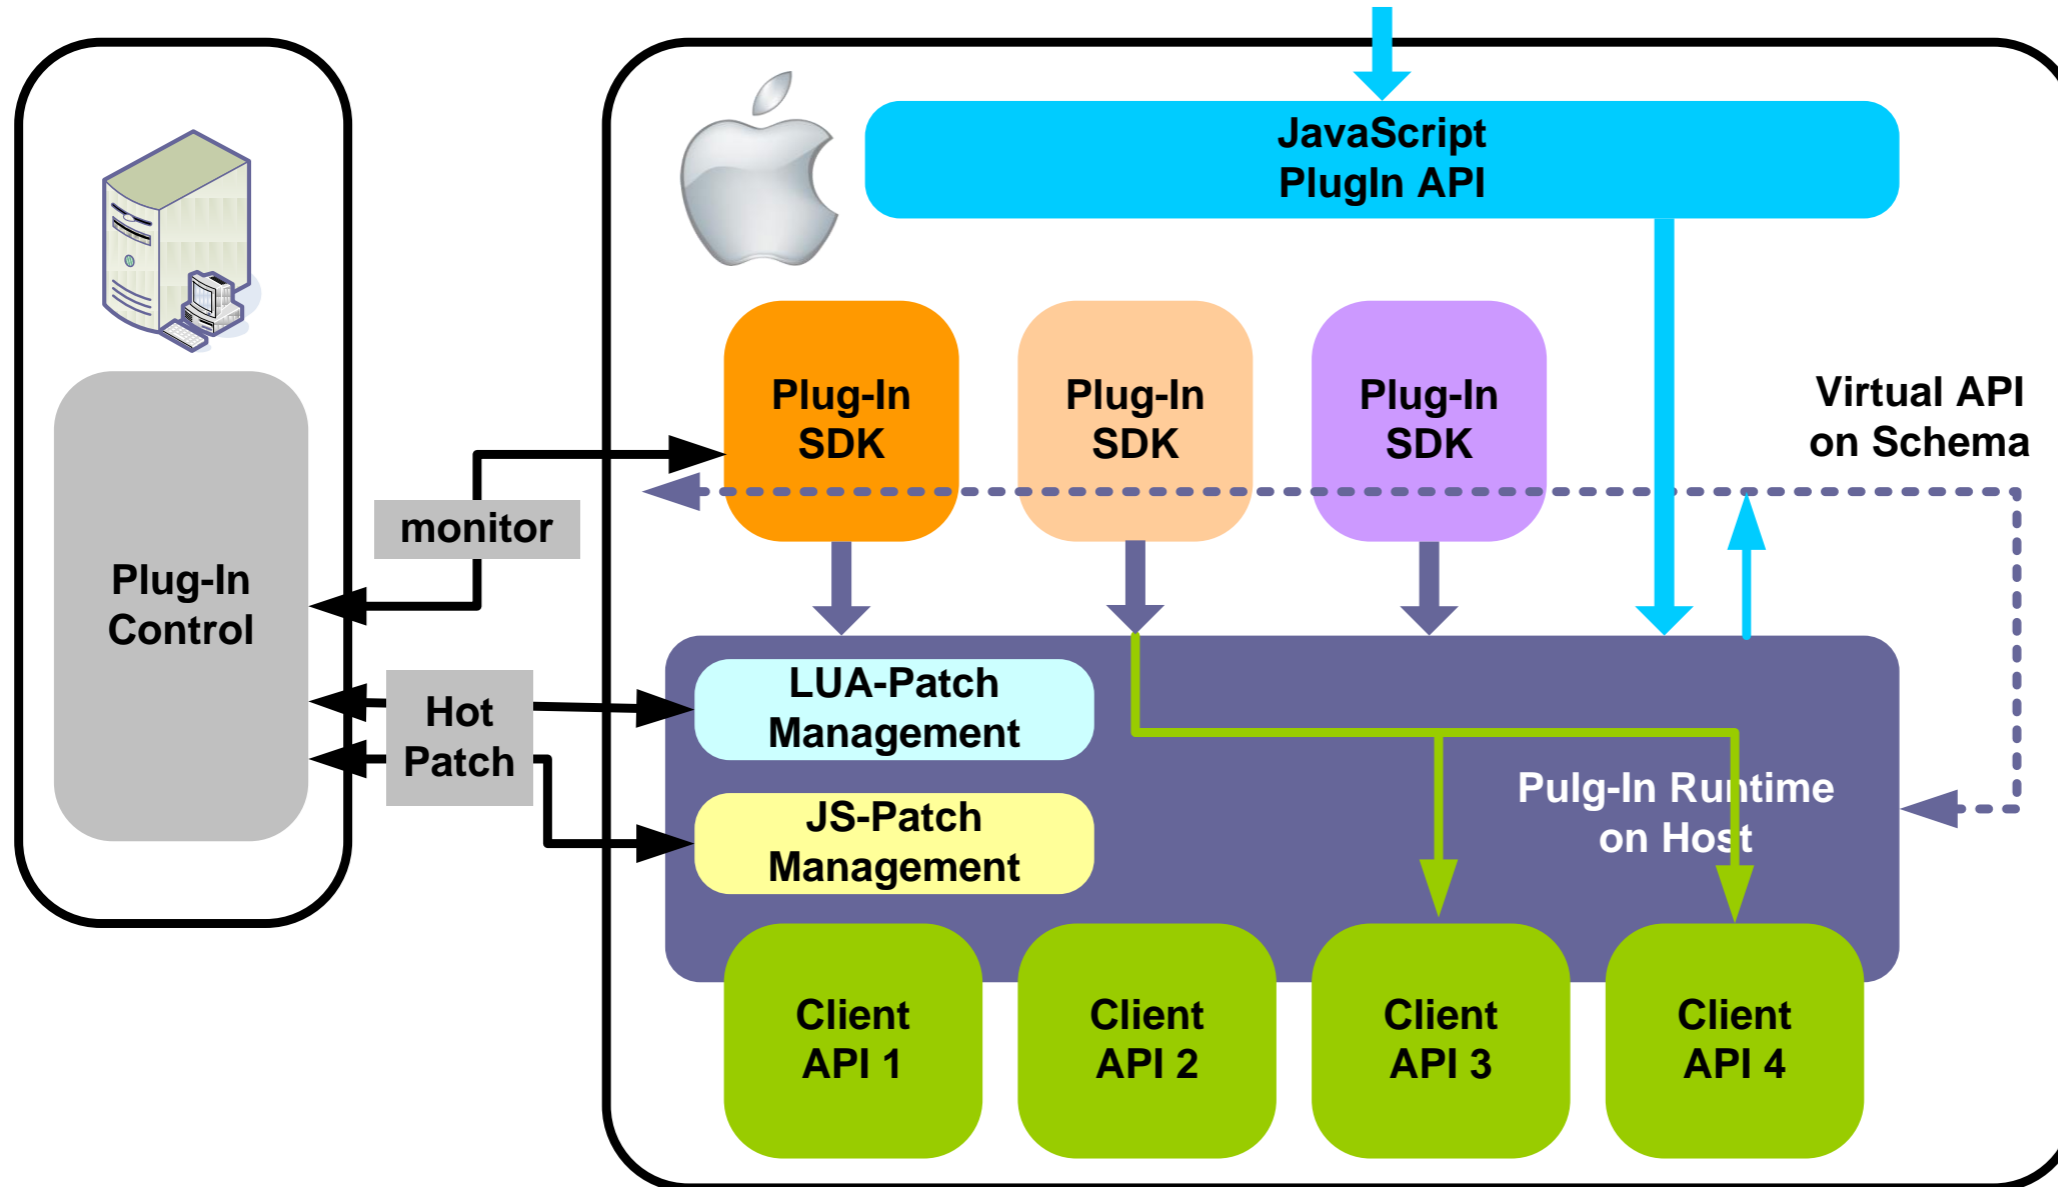

- Account
- Share
- Pay
- Cards
- Some UIs
-

Client Plug-in System: Android

Client Plug-in System: iPhone

Search On Mobile Application

- About Baidu Mobile and Search Application
- The Architecture of Baidu Mobile
- Mobile Search Basic
- Mobile Search Enhancement

Mobile Search Basic

Difficulties on Mobile

- Adapt screens
- Adapt networks
- Adapt devices

Differences on Mobile

- UI Behavior
- User Scene

Features on Mobile

- Enhance the display for results
- Media-Rich Search
(Voice Search, Image Search)

Chrome

Baidu Browser

Baidu Mobile

Page Display Layer

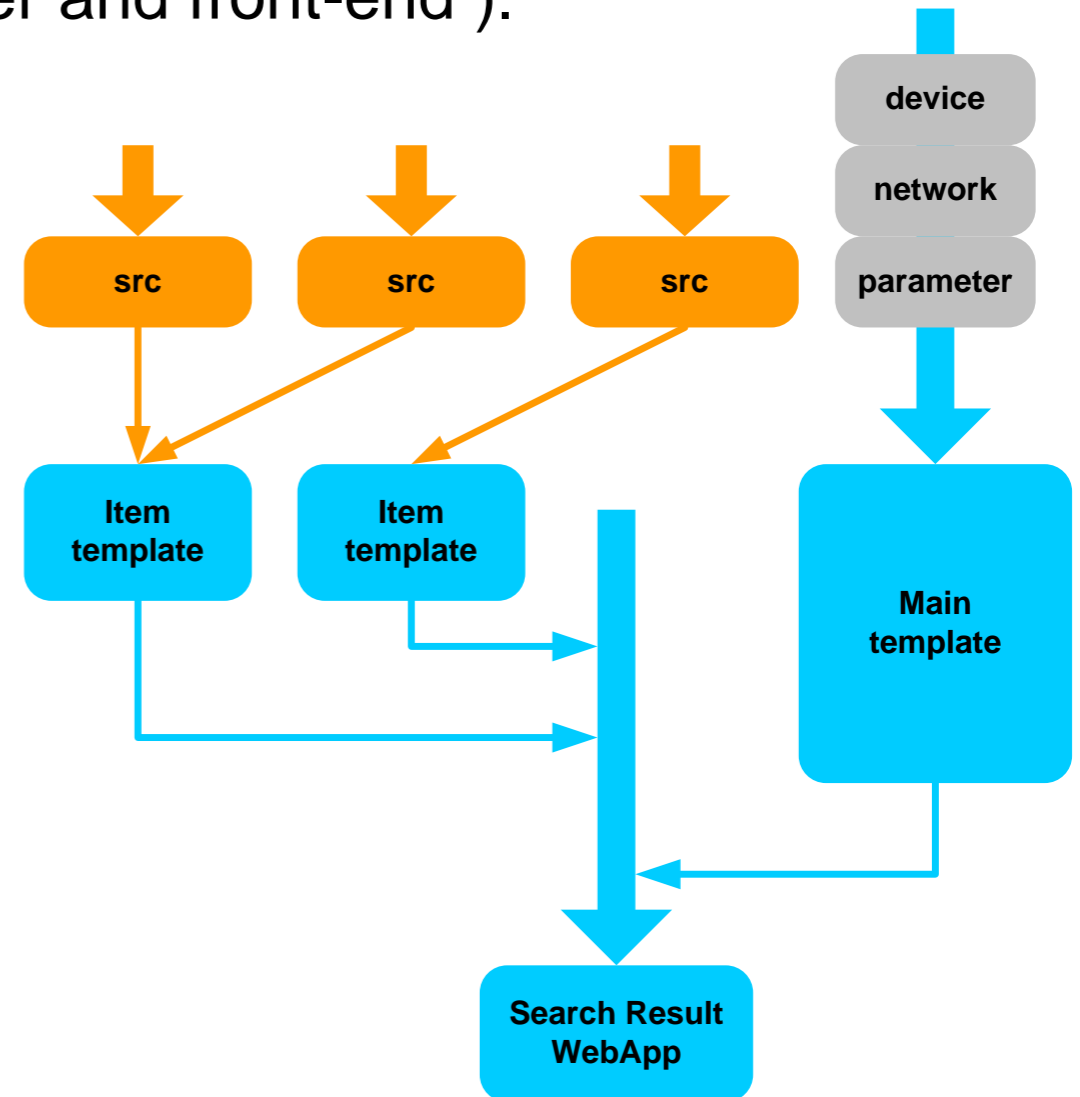

Page Display Layer works as container (server and front-end).

Main Template:

- Depend on Devices, network, parameter
- Server => Distinguish difference
- JavaScript => Use host ability

Item Template:

- Template + Resource => Display Item
- Only answer => highlight result
- Weak Item => for secondary order item
- Use behavior => feedback to order

Mobile Contents

The points for mobile contents:

- Mobile device type and ability
=> different content
- When there is a mobile query request from mobile device. It will provide:
 - ◆ Mobile original content
 - ◆ Mobile transcoding content
- There is a rule for mapping the Mobile H5 Resource and PC resource.
- H5 Resource inherits the link relationship and right information of PC.

若你不弃此生不离最新章节

作者: 锦竹

Demand Analysis

The points of Demand Analysis on Mobile Device:

- According to the orientation of query, recognize the user needs and find the corresponding standard category
- According to the corresponding category in the field of information, extract the specific tag field to support detailed query and selection of vertical resource ,
- Provide the internal subclass, and give the importance of distinguishing

How to Enhance Searching on Mobile Application

Powerful
Interactive

Information
Closed-
Loop

Communic
ation on
Search

**Several Technical points
For Business Feature**

Connect Web Page and Native UI
Mechanism First , Vertical Business Later
Change one point => extend to global
Reserve the content and rank

JS-Bridge capability
@ Search Result Page

Native UI capability
@ Browsers

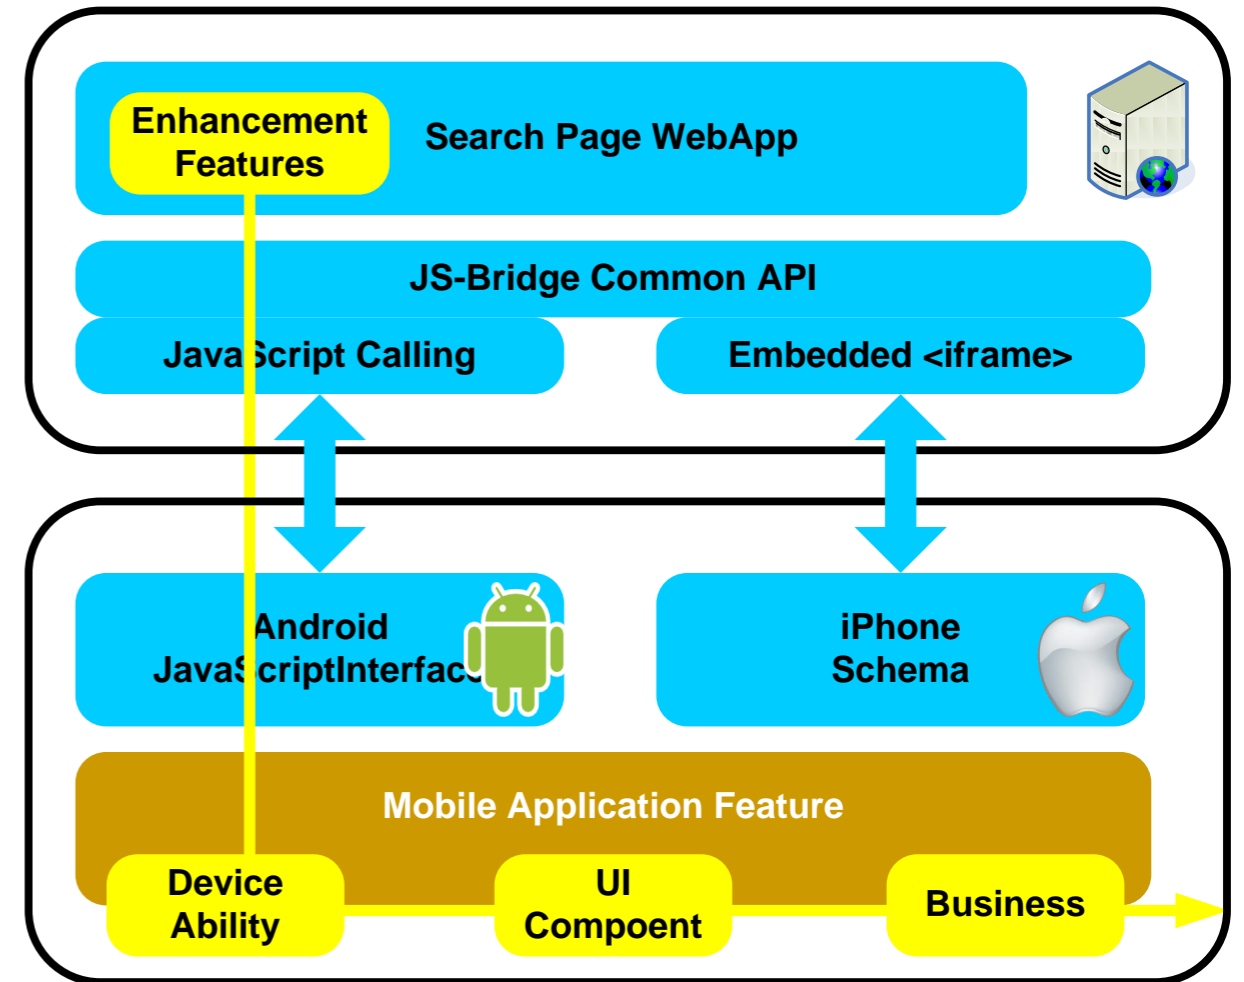

Message capability
@ Mobile Client

Technical Core-Competitiveness

JS-Bridge capability @ Search Result Page

JS-Bridge capability => hybrid WebApp.

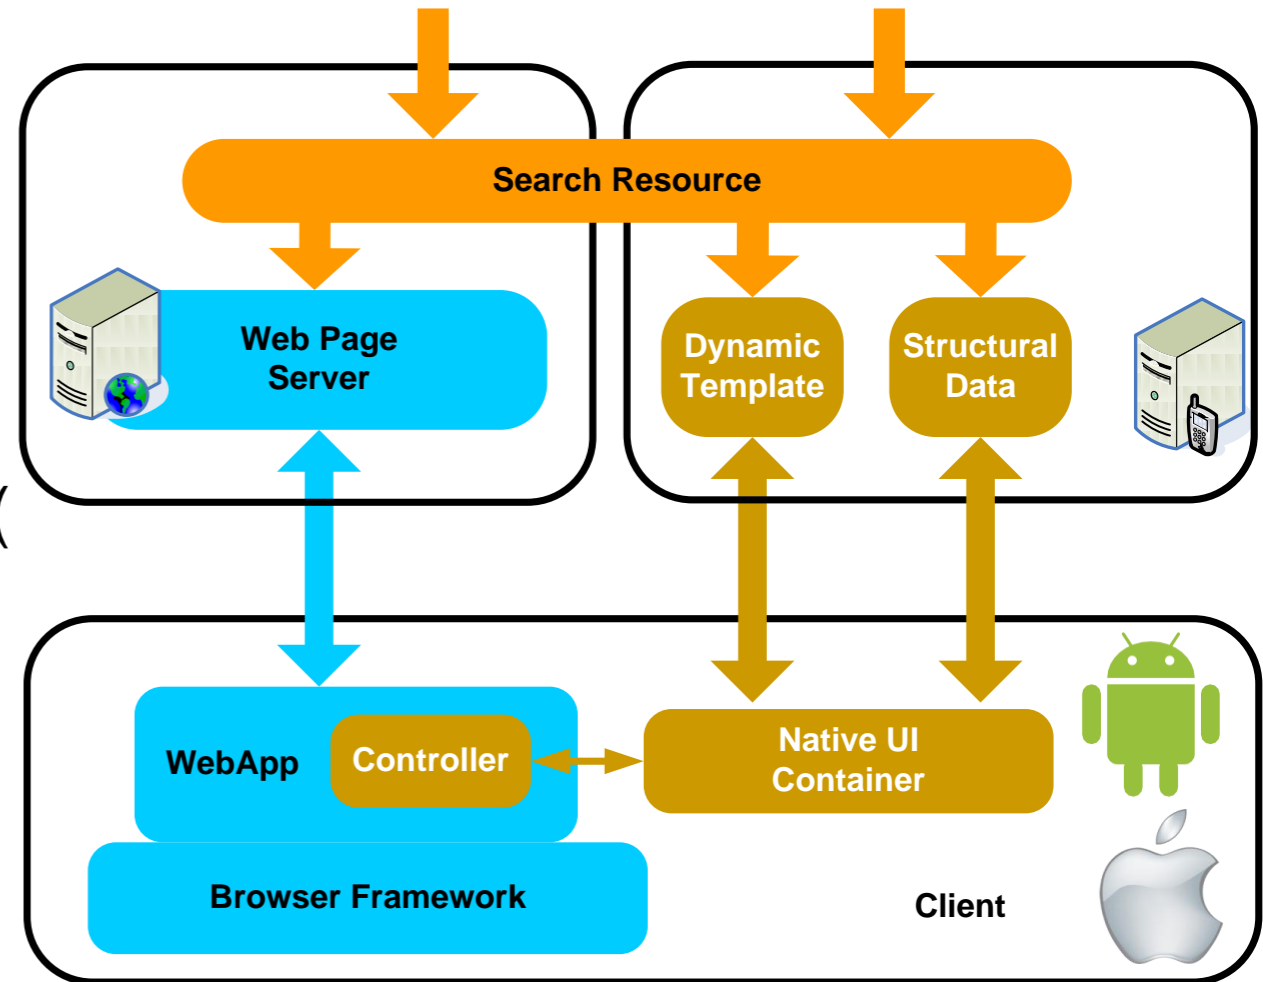

- Use native device or system ability
- Use the additional native UI
- Use additional API for special business
- JS-Bridge module works as separated component
- JS-Bridge can work with the every result item component
- Target also includes the landing page

Native UI capability @ Browsers

Native UI with browsers framework:

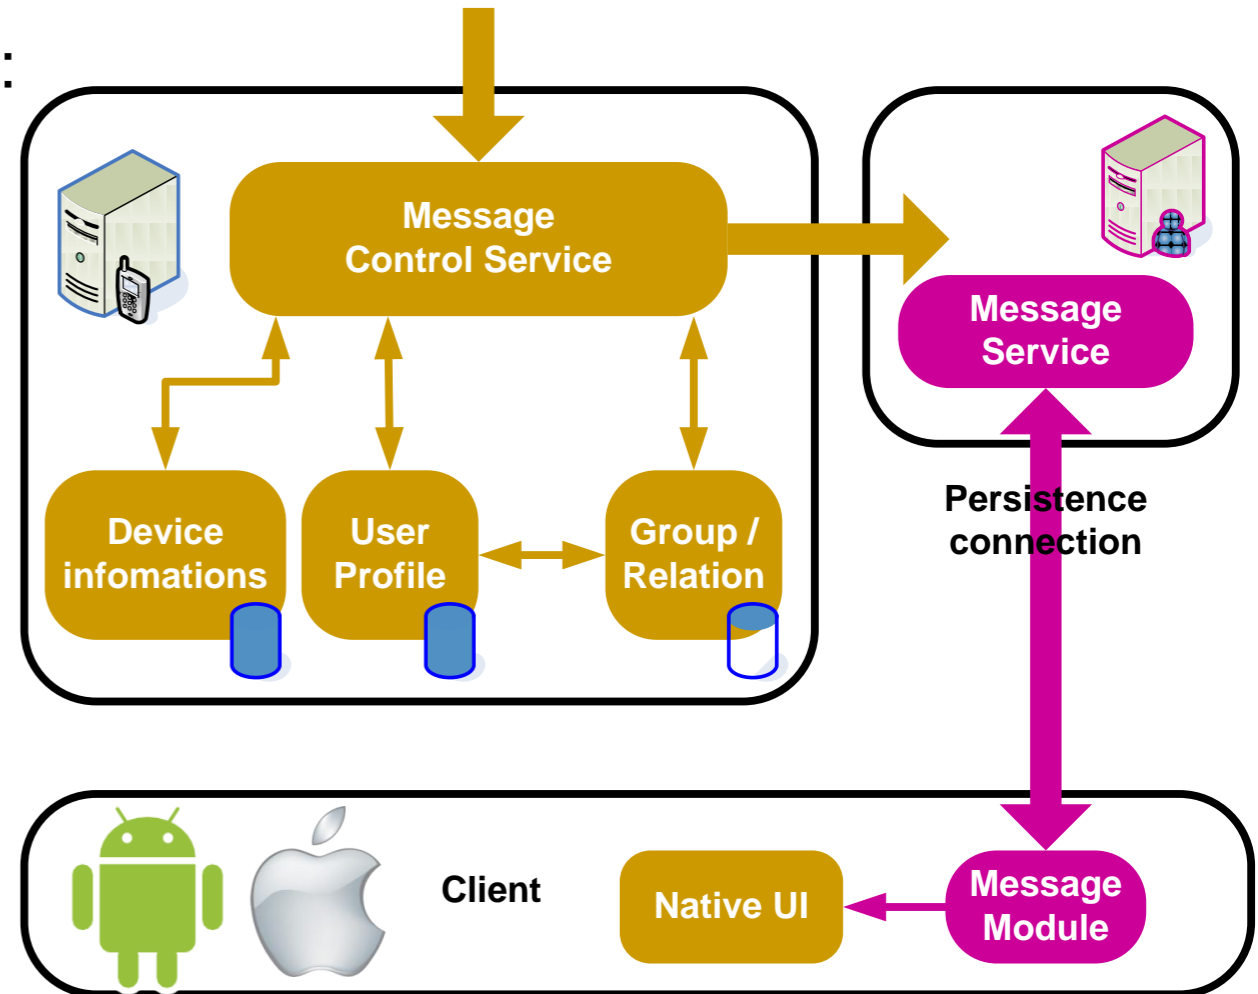

- Flexible as Web
- High performance
- Support Gesture
- Support the general browsers behavior(Back, Forward, Share, URL)
- Support Multi-Windows with browsers
- Maintain the state machine in webpage

Message capability @ Mobile Client

Message is special ability on Mobile Client:

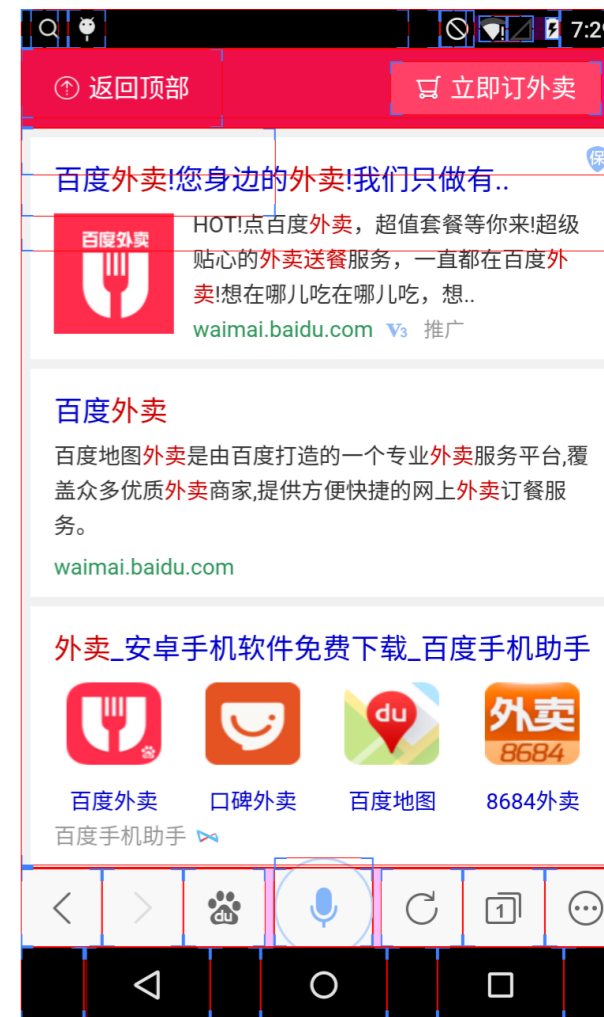

- Persistence connection between Client and Server
- Client notification
- User Profile: from login users
- Device Profile: from mobile devices
- Data Collection: build the relations
- User Behavior: build the groups

Powerful Interactive

Features:

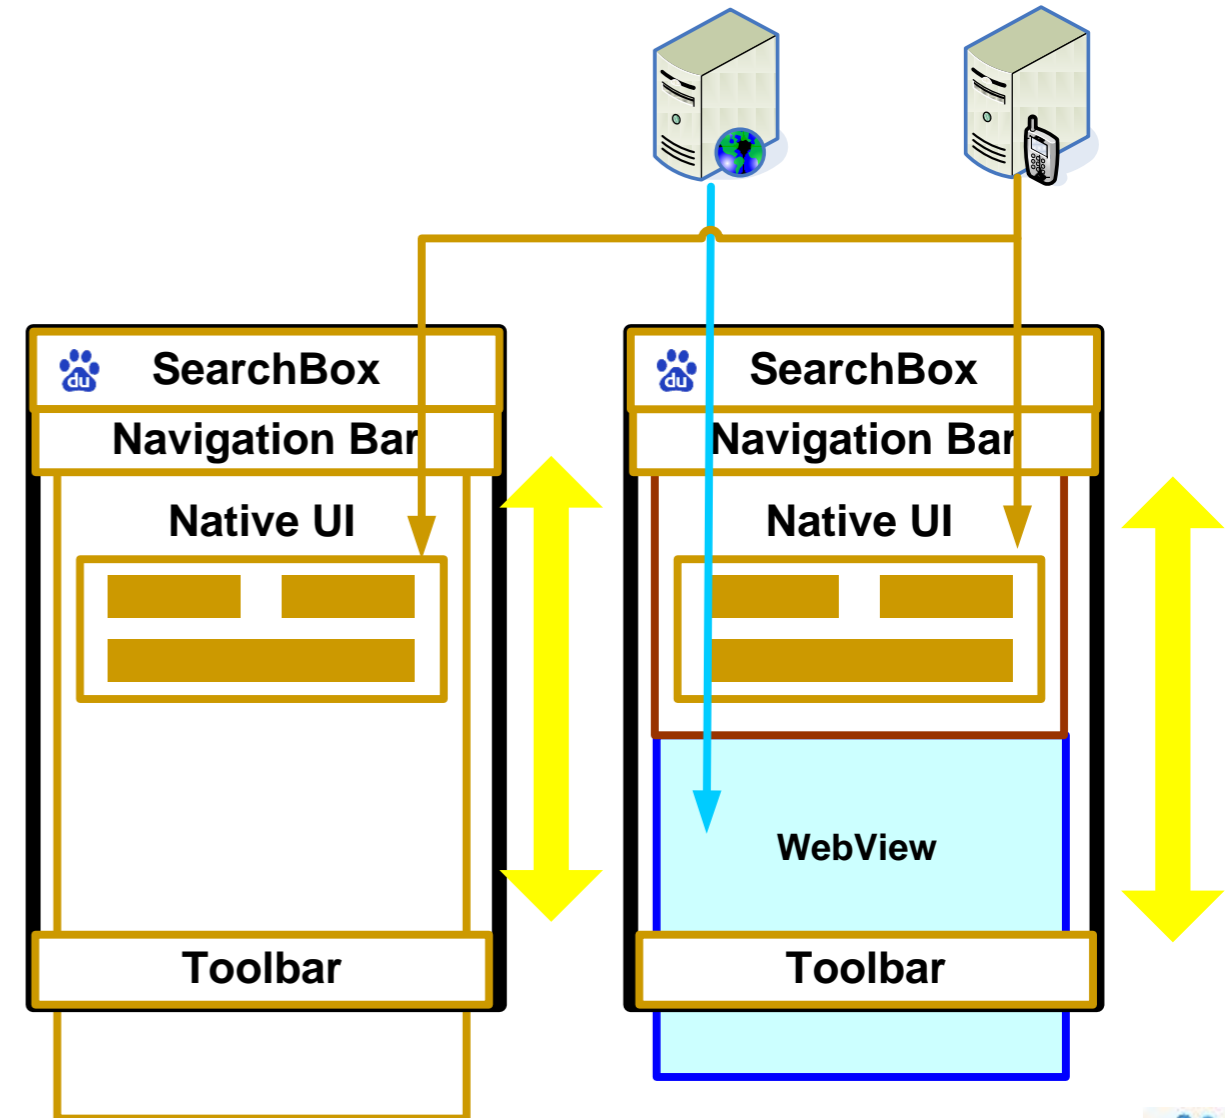

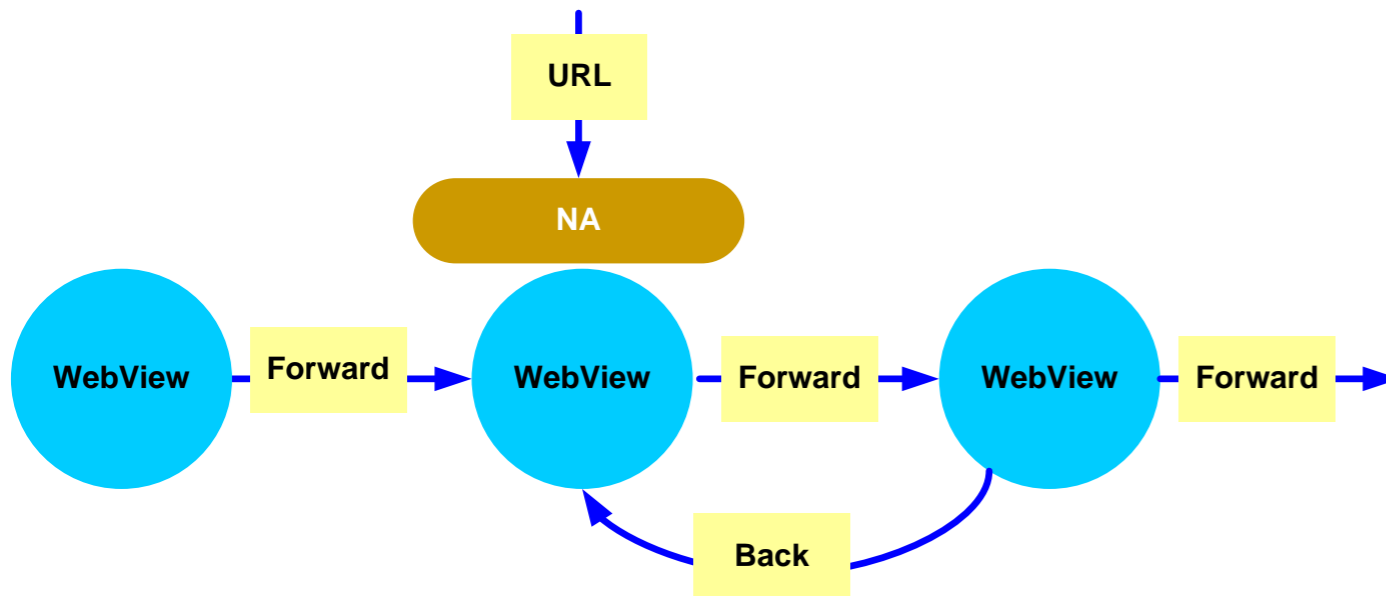

- Search Result as Application
- Powerful UI rather than web app
- Following the browsers behaviors
- Expanded Status for O2O
- Closed Status for other result

Powerful Interactive

The technical points:

- Dynamic template of Client / Server
- Associated behaviors and animation of Native UI and WebView
- History and re-entry of Web Pages

Information closed-loop

Features:

- Result => become a Card
- Card => show the information directly
- Card action => conduct user to any where
- Card => attach to a reminding
- Reminding => trigger some message
- Messages => back to the application

Search Result

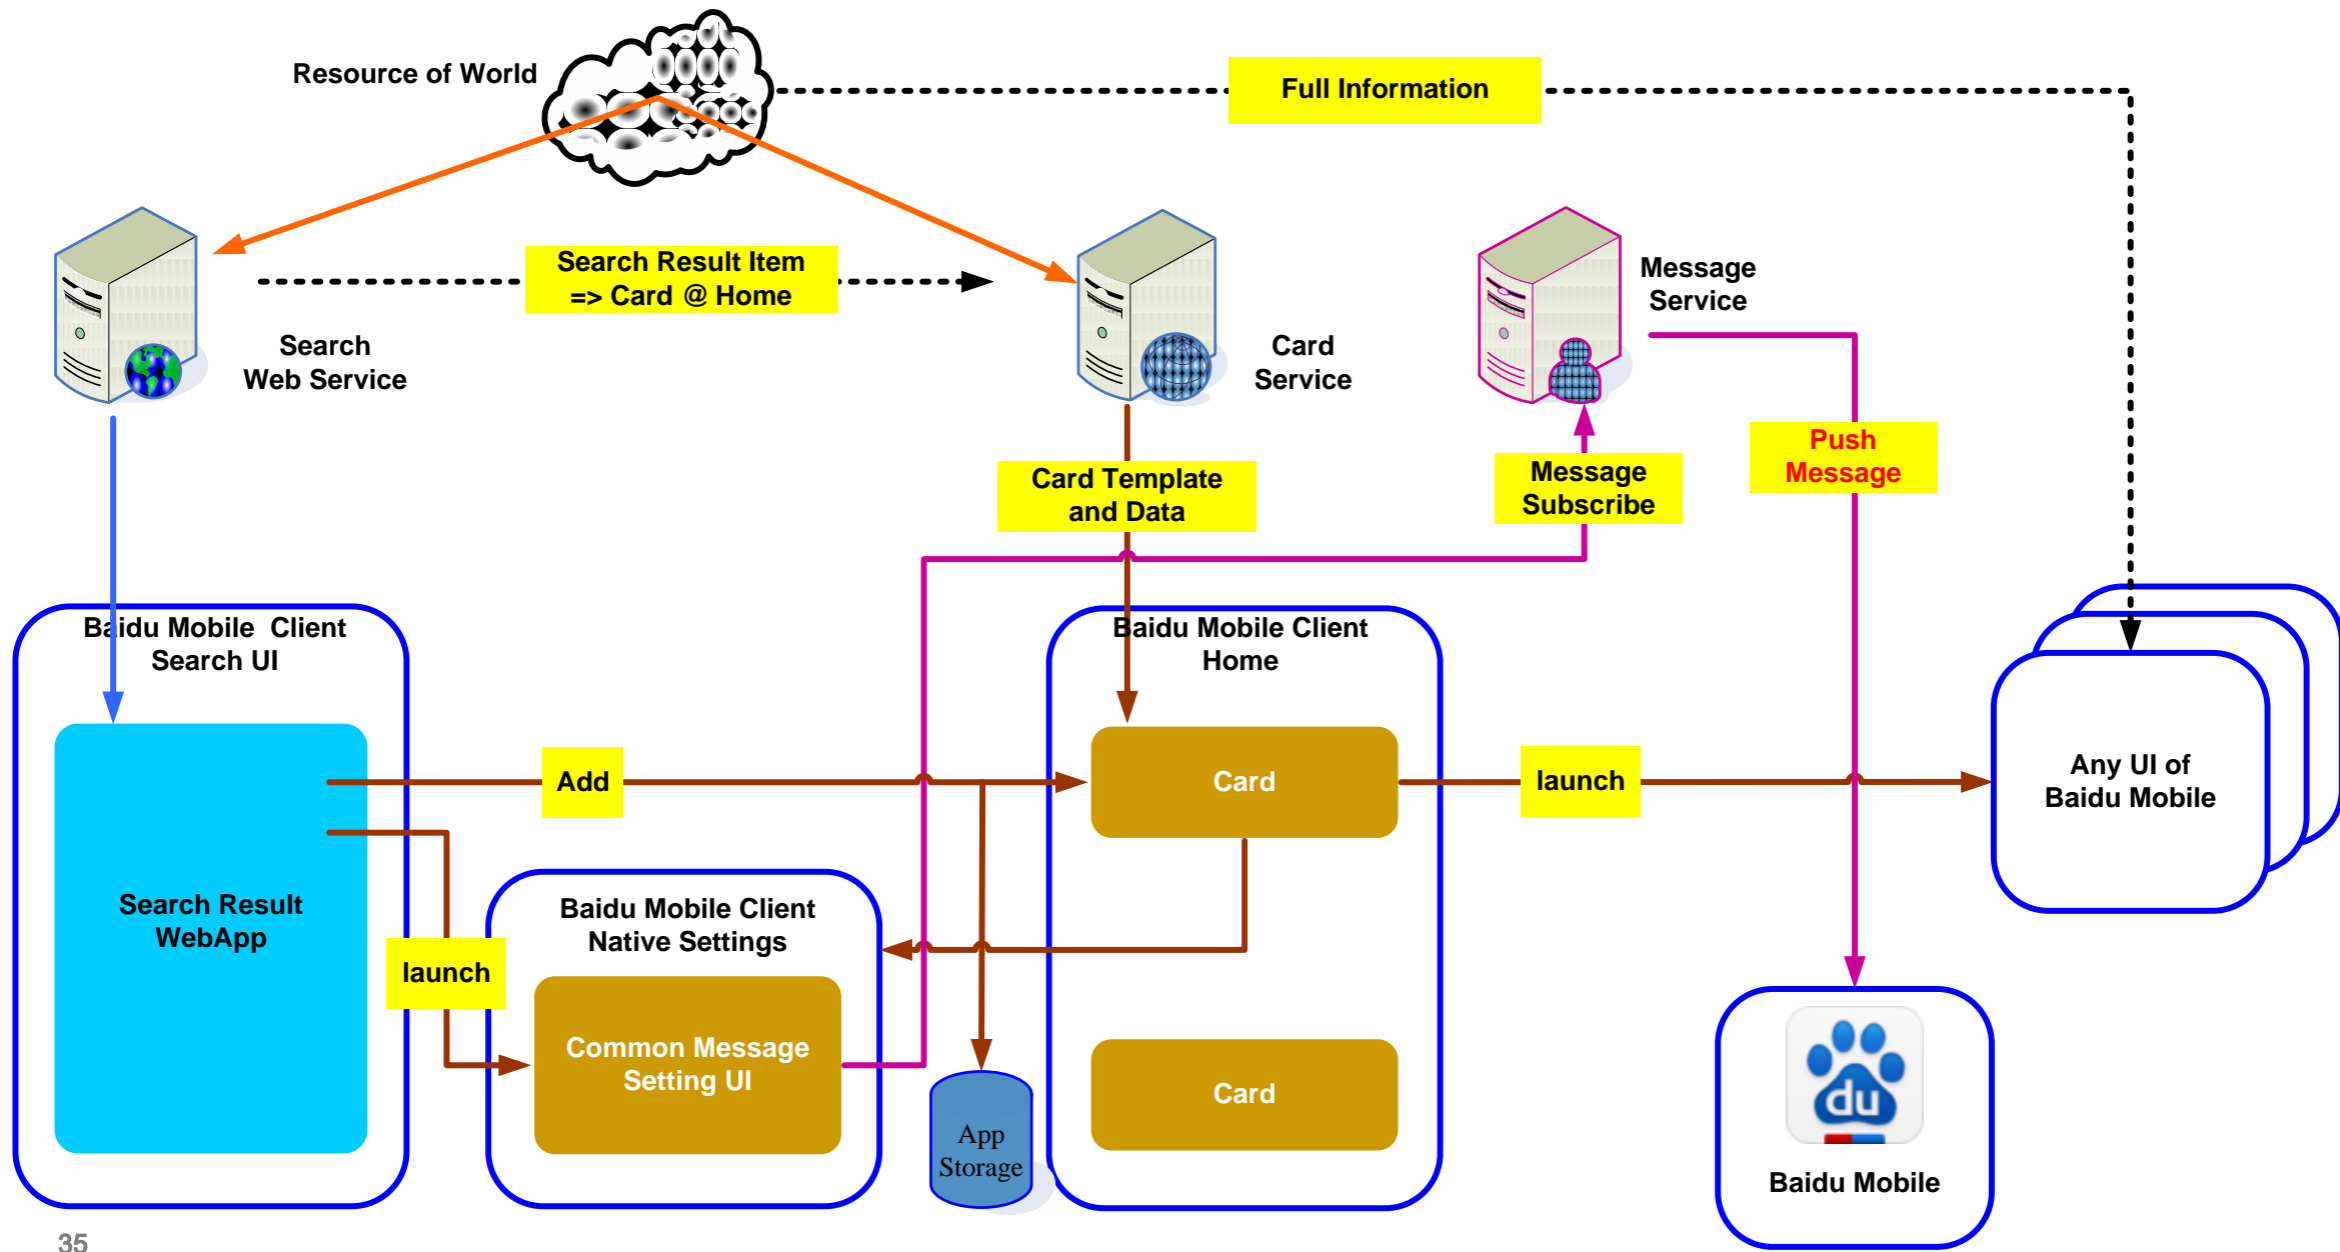

Cards @ Home

Remind Settings

Information closed-loop

Communication on Search

Features:

- Result => attach to comments entry
- The comments => attract users to communicate
- Users => Setup relation
- Users => Gather as groups
- User characters => be dug
- User information => Generate some messages
- Messages => a notification to users

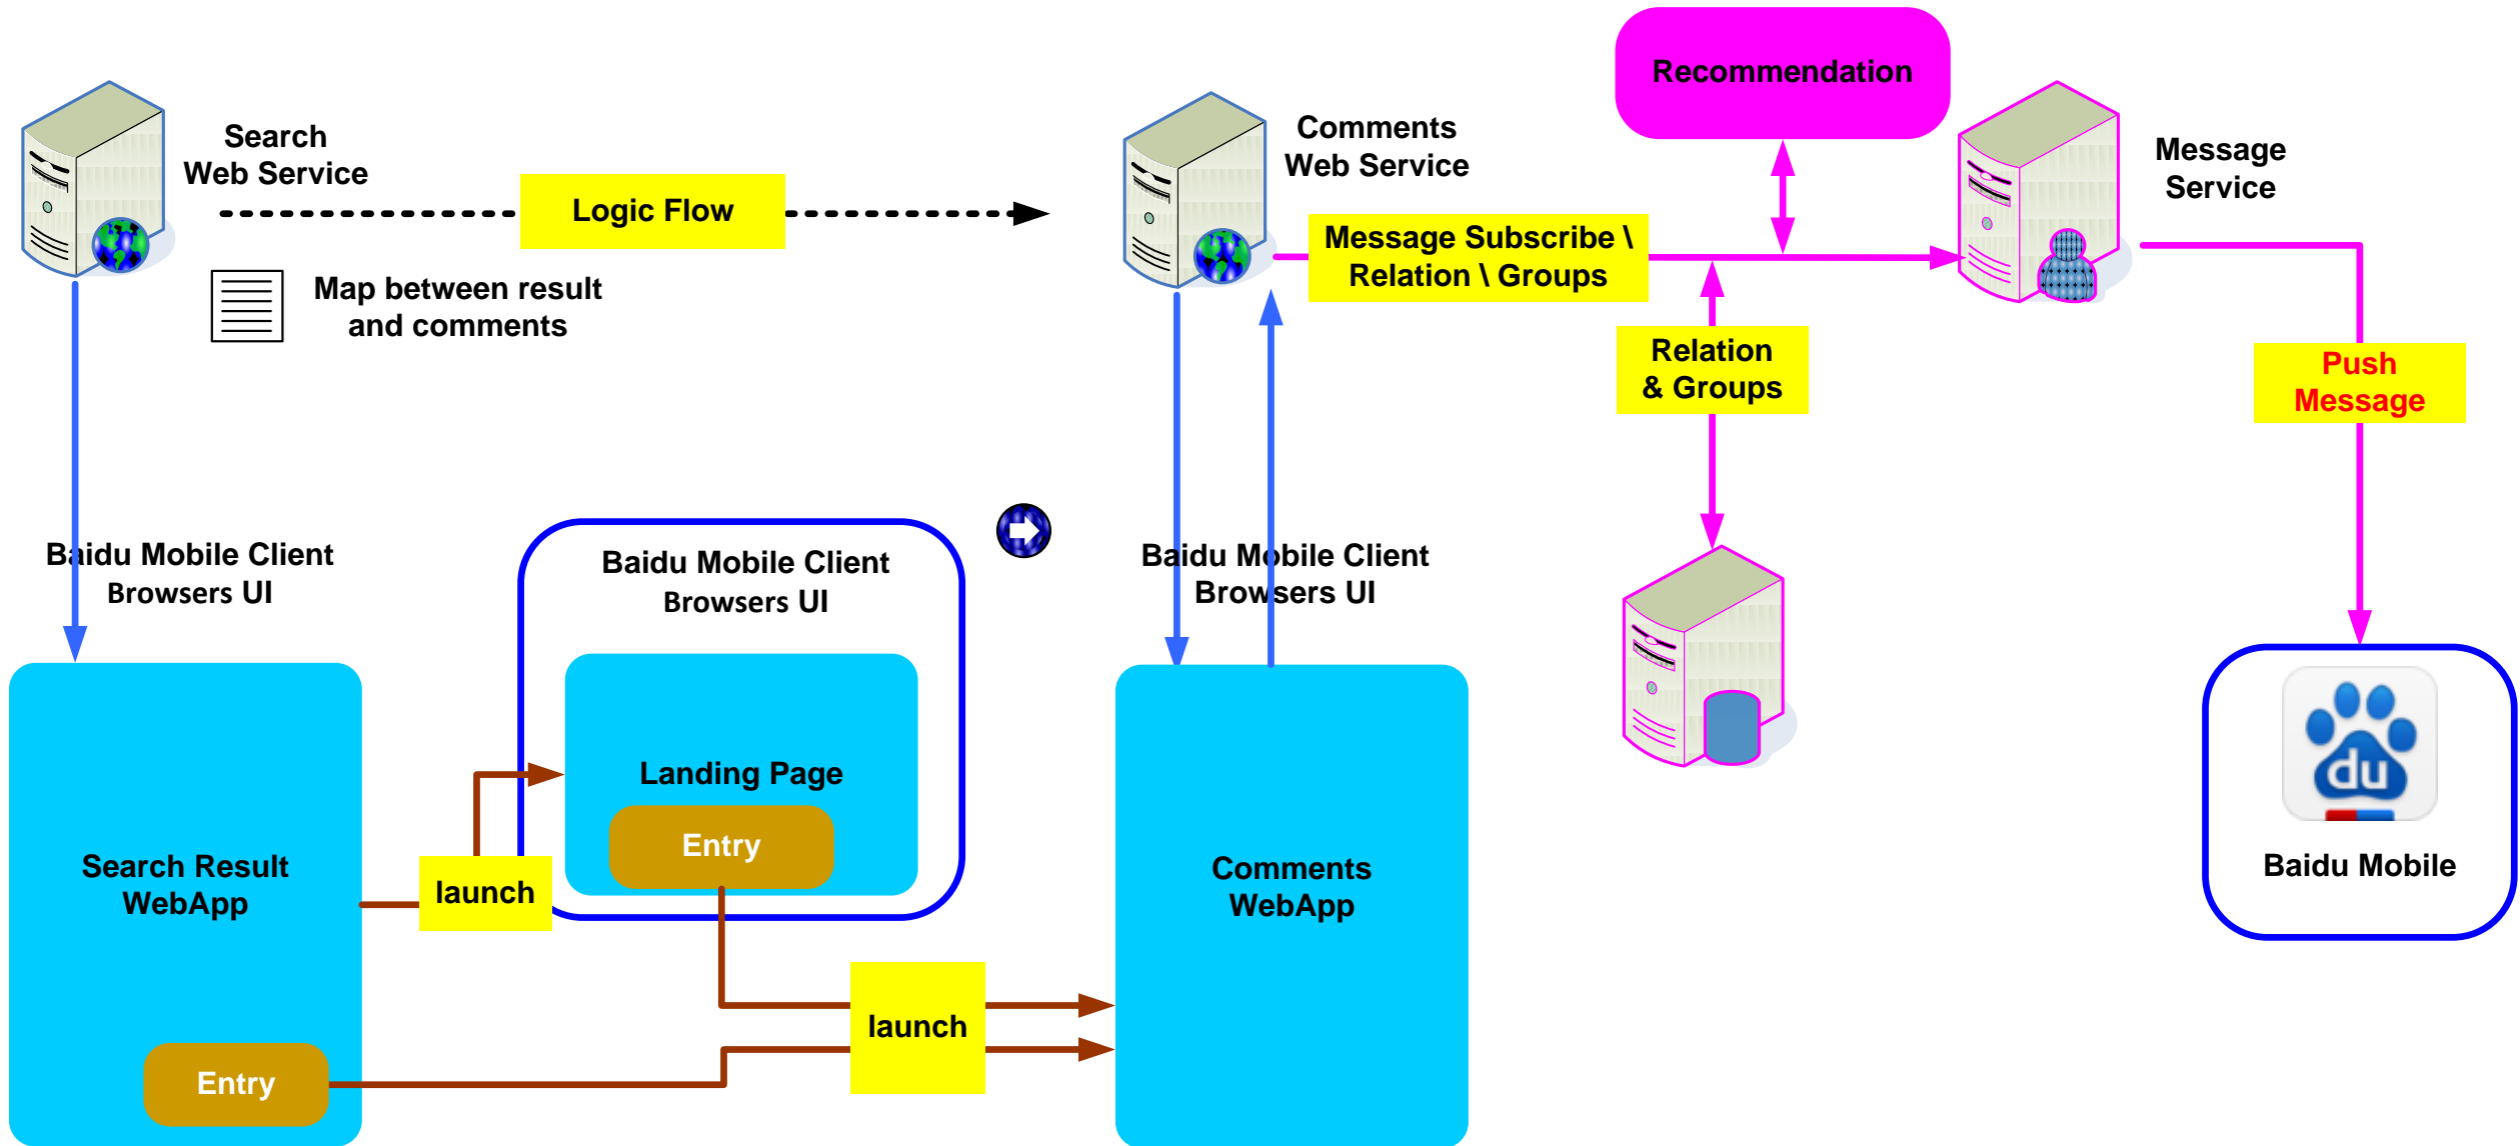

Search Result

Comment Website

Communication on Search

Thanks!
