

Massive Scale Deployment / Connectivity

Norman Maurer

- Senior Software Engineer @ Apple
- Core Developer of Netty
- Formerly worked @ Red Hat as Netty Project Lead (internal Red Hat)
- Author of Netty in Action (Published by Manning)
- Apache Software Foundation
- Eclipse Foundation

Massive Scale

Massive Scale

What does "Massive Scale" mean...

Instances of Netty based Services in Production:

- Data / Day:
- Requests / Second:
- Versions:

400,000+ 10s of PetaBytes 10s of Millions 3.x (migrating to 4.x), 4.x

- Contributing back to the Community
- 250+ commits from Apple Engineers in 1 year

Using an Apple Service? Chances are good Netty is involved somehow.

- Native Transport
- TCP / UDP / Domain Sockets
- PooledByteBufAllocator
- OpenSslEngine
- ChannelPool
- protocols

Areas of importance

Build-in codecs + custom codecs for different

With Scale comes Pain

JDK NIO

... some pains

Some of the pains

- Selector.selectedKeys() produces too much garbage
- NIO implementation uses synchronized everywhere!
- Not optimized for typical deployment environment (support common denominator of all environments)
- Internal copying of heap buffers to direct buffers

JNI to the rescue

- Optimized transport for Linux only
- Supports Linux specific features
- Directly operate on pointers for buffers
- Synchronization optimized for Netty's Thread-Model

Native Transport epoll based high-performance transport

NIO Transport

Native Transport

- Less GC pressure due less Objects
- Advanced features
 - SO_REUSEPORT
 - TCP_CORK,
 - TCP_NOTSENT_LOWAT
 - TCP_FASTOPEN
 - TCP_INFO
- LT and ET
- Unix Domain Sockets

Buffers

JDK ByteBuffer

Direct buffers are free'ed by GC
Not run frequently enough

May trigger GC

Hard to use due not separate indices

- Direct buffers == expensive
- Heap buffers == cheap (but not for free*)
- Fragmentation

*byte[] needs to be zero-out by the JVM!

Buffers

Buffers - Memory fragmentation

Waste memory •

Can't insert int here as we need 4 continuous slots

May trigger GC due lack of coalesced free memory

Allocation times

PooledByteBufAllocator

- Based on jemalloc paper (3.x)
- ThreadLocal caches for lock-free allocation in most cases <u>#808</u>
- Synchronize per Arena that holds the different chunks of memory
- Different size classes
- Reduce fragmentation

ThreadLocal caches

- Able to enable / disable ThreadLocal caches
- Fine tuning of Caches can make a big difference
- Best effect if number of allocating Threads are low.
- Using ThreadLocal + MPSC queue <u>#3833</u>

JDK SSL Performance it's slow!

Why handle SSL directly?

- Secure communication between services Used for HTTP2 / SPDY negotiation
- Advanced verification of Certificates

Unfortunately JDK's SSLEngine implementation is very slow :(

HTTPS Benchmark JDK SSLEngine implementation

Response

HTTP/1.1 200 OK Content-Length: 15 Content-Type: text/plain; charset=UTF-8 Server: Netty.io Date: Wed, 17 Apr 2013 12:00:00 GMT

Hello, World!

Benchmark

./wrk -H 'Host: localhost' -H 'Accept: text/html,application/xhtml+xml,application/ xml;q=0.9,*/*;q=0.8' -H 'Connection: keep-alive' -d 120 -c 256 -t 16 -s scripts/ pipeline-many.lua <u>https://xxx:8080/plaintext</u>

Result

Running 2m test @ https://xxx:8080/plaintext 16 threads and 256 connections Thread Stats Avg Stdev Max +/- Stdev Latency 553.70ms 81.74ms 1.43s 80.22% Req/Sec 7.41k 595.69 8.90k 63.93% 14026376 requests in 2.00m, 1.89GB read Socket errors: connect 0, read 0, write 0, timeout 114 Requests/sec: **116883.21** Transfer/sec: **16.16MB**

Tasks: 154 total, 12 running Load average: 4.62 1.96 Uptime: 53 days, 19:29:17

- Unable to fully utilize all cores
- SSLEngine API limiting in some cases
 - SSLEngine.unwrap(...) can only take one ByteBuffer as src

JNI based SSLEngine ... to the rescue

JNI based SSLEngine

...one to rule them all

- Supports OpenSSL, LibreSSL and BoringSSL
- Based on Apache Tomcat Native •

Was part of Finagle but contributed to Netty in 2014

- All cores utilized!
- Makes use of native code provided by OpenSSL
- Low object creation
- Drop in replacement*

*supported on Linux, OSX and Windows

Optimizations made

- Added client support: <u>#7, #11, #3270, #3277, #3279</u>
- Added support for Auth: <u>#10</u>, <u>#3276</u>
- GC-Pressure caused by heavy object creation: <u>#8</u>, <u>#3280</u>, <u>#3648</u>
- Too many JNI calls: <u>#3289</u>
- Proper SSLSession implementation: <u>#9</u>, <u>#16</u>, <u>#17</u>, <u>#20</u>, <u>#3283</u>, <u>#3286</u>, #3288
- ALPN support <u>#3481</u>
- Only do priming read if there is no space in dsts buffers <u>#3958</u> •

Thread Model

- Easier to reason about
- Less worry about concurrency
- Easier to maintain
- Clear execution order

Thread Model

```
public class ProxyHandler extends ChannelInboundHandlerAdapter {
  @Override
  public void channelActive(ChannelHandlerContext ctx) {
    final Channel inboundChannel = ctx.channel();
    Bootstrap b = new Bootstrap();
    b.group(inboundChannel.eventLoop());
    ctx.channel().config().setAutoRead(false);
    ChannelFuture f = b.connect(remoteHost, remotePort);
    f.addListener(f -> {
        if (f.isSuccess()) {
            ctx.channel().config().setAutoRead(true);
        } else { ...}
    });
    }
}
```

Backpressure

Slow peers due slow connection

• Risk of writing too fast

Backoff writing and reading

Memory Usage

- Handling a lot of concurrent connections
- Need to safe memory to reduce heap sizes
 - Use Atomic*FieldUpdater
 - Lazy init fields

Connection Pooling

Ilexible / extensible implementation

• Having an extensible connection pool is important <u>#3607</u>

Thanks

We are hiring! http://www.apple.com/jobs/us/
