“containers  
aren't real”

– @jessfraz

KEYNOTE

 UNIVERSE

@bridgetkromhout

#qconsf

# What is a **container**?

**Not a real thing.** An application delivery mechanism with **process isolation** based on several **Linux kernel** features.

## Namespaces

**(what a process can see)**

- PID
- Mount
- Network
- UTS
- IPC
- User
- Cgroup

## Cgroups

**(what a process can use)**

- Memory
- CPU
- Blkio
- Cpuacct
- Cpuset
- Devices
- Net\_prio
- Freezer

# containers solve problems

CONSISTENT DEVELOPMENT

# **Kubernetes:** empowering you to do more

Deploy your applications quickly and predictably

Scale your applications on the fly

Roll out new features seamlessly

Limit hardware usage to required resources

“day 2 k8s” - what do we mean?

1. You're sold on k8s; what's next?
2. necessarily opinionated...
- 3....yet giving you info to decide.

# operable k8s: next steps

- Getting started with Terraform & hosted k8s
- Managing configs with Helm & apps with Draft
- Event-driven scripting with Brigade & Kasti

# Terraform

Deploy k8s clusters, pods, and services!

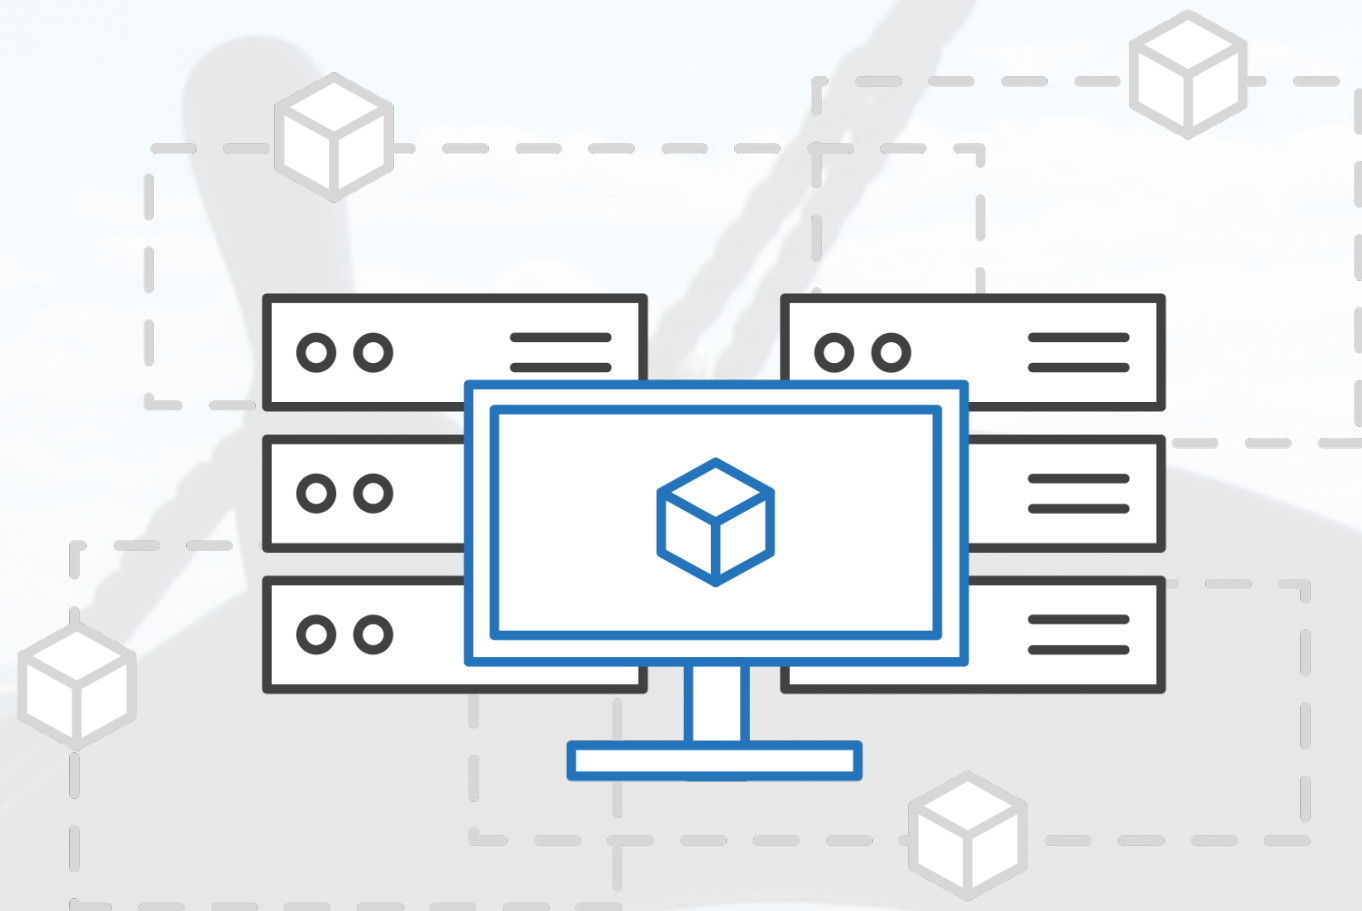

Find providers: <https://registry.terraform.io/>

Providers include Azure & Azure Stack, as well as other clouds.

# Azure Kubernetes Service (AKS)

Simplify the deployment, management,  
and operations of Kubernetes

Focus on your  
containers not the  
infrastructure

Work how you  
want with open-  
source APIs

Scale and run  
applications with  
confidence

(similar options exist for your cloud of choice)

# Azure Kubernetes Service (AKS)

## Get started easily

```
$ az aks create -g myResourceGroup -n myCluster --generate-ssh-keys  
\ Running ..
```

```
$ az aks install-cli
```

```
Downloading client to /usr/local/bin/kubectl ..
```

```
$ az aks get-credentials -g myResourceGroup -n myCluster
```

```
Merged "myCluster" as current context ..
```

```
$ kubectl get nodes
```

NAME	STATUS	AGE	VERSION
aks-mycluster-36851231-0	Ready	4m	v1.8.1
aks-mycluster-36851231-1	Ready	4m	v1.8.1
aks-mycluster-36851231-2	Ready	4m	v1.8.1

# Azure Kubernetes Service (AKS)

## Manage an AKS cluster

```
$ az aks list -o table
```

Name	Location	ResourceGroup	KubernetesRelease	ProvisioningState
myCluster	westus2	myResourceGroup	1.7.7	Succeeded

```
$ az aks upgrade -g myResourceGroup -n myCluster --kubernetes-version 1.8.1  
\ Running ..
```

```
$ kubectl get nodes
```

NAME	STATUS	AGE	VERSION
aks-mycluster-36851231-0	Ready	12m	v1.8.1
aks-mycluster-36851231-1	Ready	8m	v1.8.1
aks-mycluster-36851231-2	Ready	3m	v1.8.1

```
$ az aks scale -g myResourceGroup -n myCluster --agent-count 10  
\ Running ..
```

# The package manager for Kubernetes

Helm is the best way to find, share, and use software built for Kubernetes.

# Helm

Find, share, and use software built for k8s

**Manage complexity**

**Simple sharing**

**Easy updates**

**Rollbacks**

# Helm

The best way to find, share, and use software built for Kubernetes

## Manage complexity

Charts can describe complex apps; provide repeatable app installs, and serve as a single point of authority

# Helm

The best way to find, share, and use software built for Kubernetes

## Easy updates

Take the pain out of updates with in-place upgrades and custom hooks

# Helm

The best way to find, share, and use software built for Kubernetes

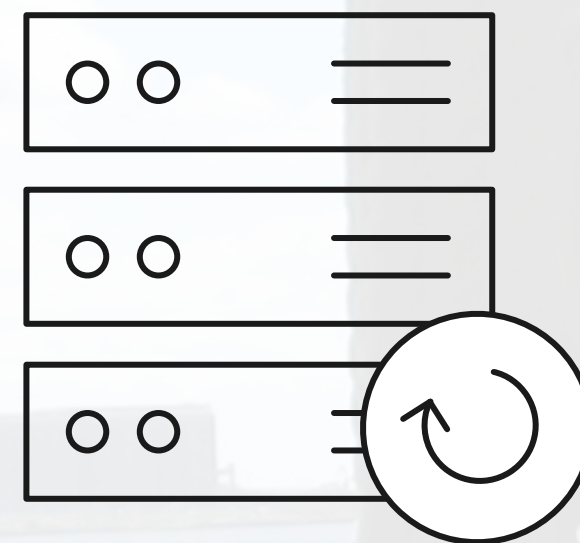

## Simple sharing

Charts are easy to version, share, and host on public or private servers

# Helm

The best way to find, share, and use software built for Kubernetes

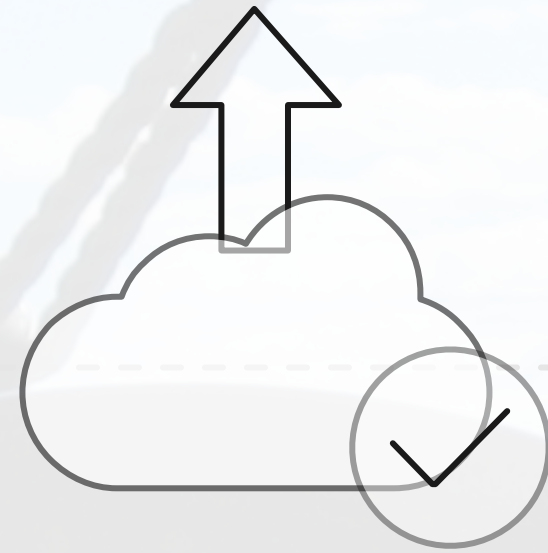

## Rollbacks

Use `helm rollback` to roll back to an older version of a release with ease

# Simple app development and deployment – into any Kubernetes cluster

## Simplified development

Using two simple commands, developers can now begin hacking on container-based applications without requiring Docker or even installing Kubernetes themselves

## Language support

Draft detects which language your app is written in, and then uses packs to generate a Dockerfile and Helm Chart with the best practices for that language

# BRIGADE

Run scriptable, automated tasks in the cloud — as part of your Kubernetes cluster

## Simple, powerful pipes

Each project gets a `brigade.js` config file, which is where you can write dynamic, interwoven pipelines and tasks for your Kubernetes cluster

## Runs inside your cluster

By running Brigade as a service inside your Kubernetes cluster, you can harness the power of millions of available Docker images

# Kashti

A simple UI to display build results and logs

## Simple visualizations

A web dashboard for Brigade, helping to easily visualize and inspect your Brigade builds

## Driving deep insights

Make Brigade DevOps workflows— projects, scripts, and jobs—and their events visible instantly

(k8s getting real)

@bridgetkromhout

#qconsf

**check out container.training...**

**...but consider managed k8s!**

**(aka choose-your-own-complexity)**

## Helm 3 changes include...

- deprecating tiller
- libraries, schematized values, and ext directory in charts
- lifecycle events
- embedded Lua engine for scripting event handlers
- Release and release version Secret objects
- new Helm Controller project for pull-based workflows

# Kubernetes API

Typical kubelets implement the pod and container operations for each node as usual.

Virtual kubelet registers itself as a “node” and allows developers to deploy pods and containers with their own APIs.

# Virtual Kubelet

recognize  
change  
exists...

@bridgetkromhout

Microsoft issued me a Mac when they hired me to help people use Linux on Azure. ✨

If this sounds like the beginning of a nerdy joke, it's because we need to question long-held opinions, let go of deeply-cherished stereotypes, and welcome this new era of open collaboration.
