fully replacing a tool, system or library.

Learning to operate Kubernetes reliably

[Julia Evans](#) on December 20, 2017 in [Engineering](#)

We recently built a distributed [cron](#) job scheduling system on top of [Kubernetes](#), an exciting new platform for container orchestration. Kubernetes is very popular right now and makes a lot of exciting promises: one of the most exciting is that engineers don't need to know or care what machines their applications run on.

Background: Netflix on AWS

- Netflix:
 - world's largest subscription Internet TV Business
 - 1,500 Employees
 - 1,000 Tech & Dev
- 53M members
- 10k starts/sec
- 7B hours streamed Q3 = 10,000 PB delivered
- >33% of Internet traffic (US, last mile, downstream)
- 60,000 instances
- 40 PB S3

Why Uber Engineering Switched from Postgres to MySQL

July 26, 2016

By *Evan Klitzke*

Introduction

The early architecture of Uber consisted of a monolithic backend application written in Python that used [Postgres](#) for data persistence. Since that time, the architecture of Uber has changed significantly, to a model of [microservices](#) and new data platforms. Specifically, in many of the cases where we previously used Postgres, we now use [Schemaless](#), a novel database sharding layer built on top of MySQL. In this article, we'll explore some of the drawbacks we found with Postgres and explain the decision to build Schemaless and other backend services on top of MySQL.

Dropbox is one of the most popular desktop applications in the world: You can install it today on Windows, macOS, and some flavors of Linux. What you may not know is that much of the application is written using Python. In fact, Drew's very first lines of code for Dropbox were written in Python for Windows using venerable libraries such as `pywin32`.

Migration:

fully replacing a tool, system or library.

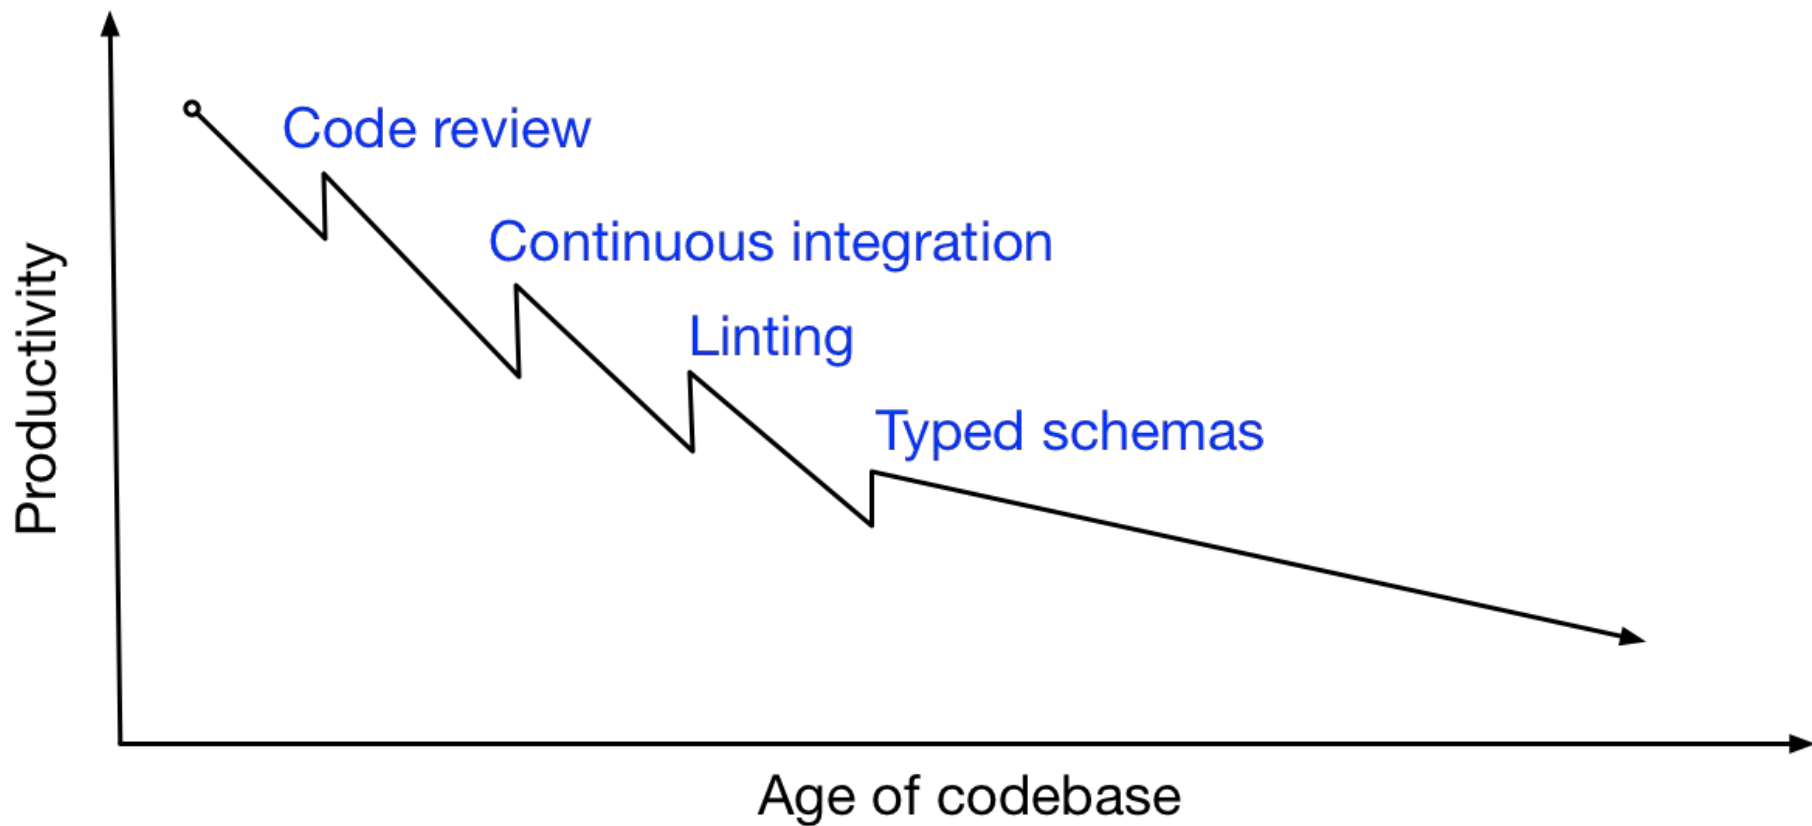

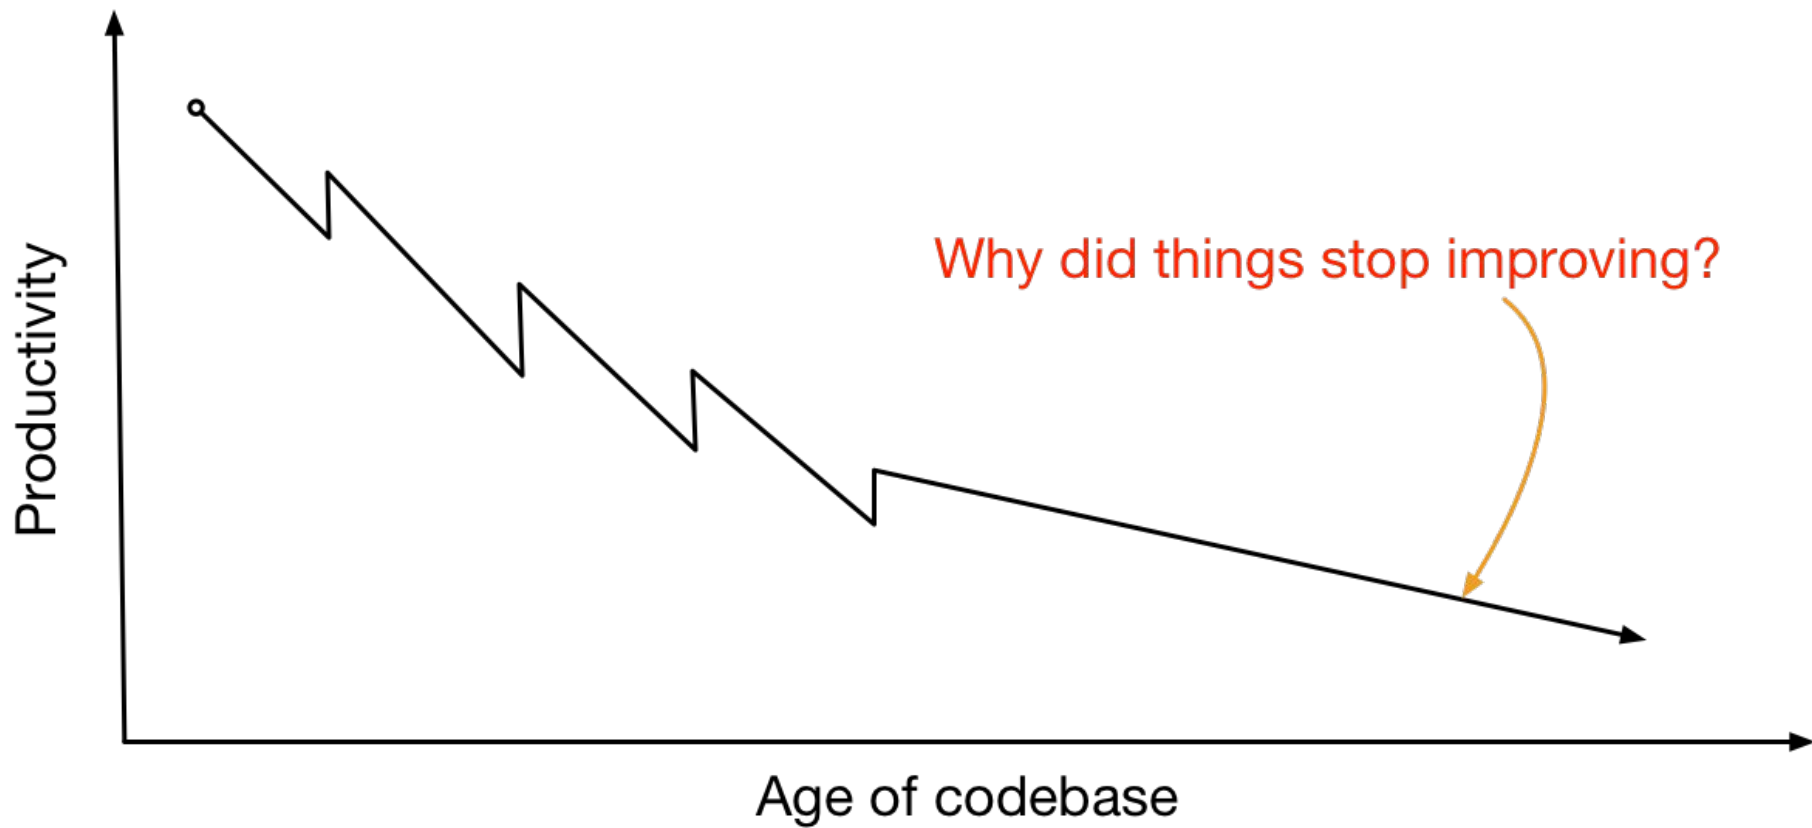

What is a migration?

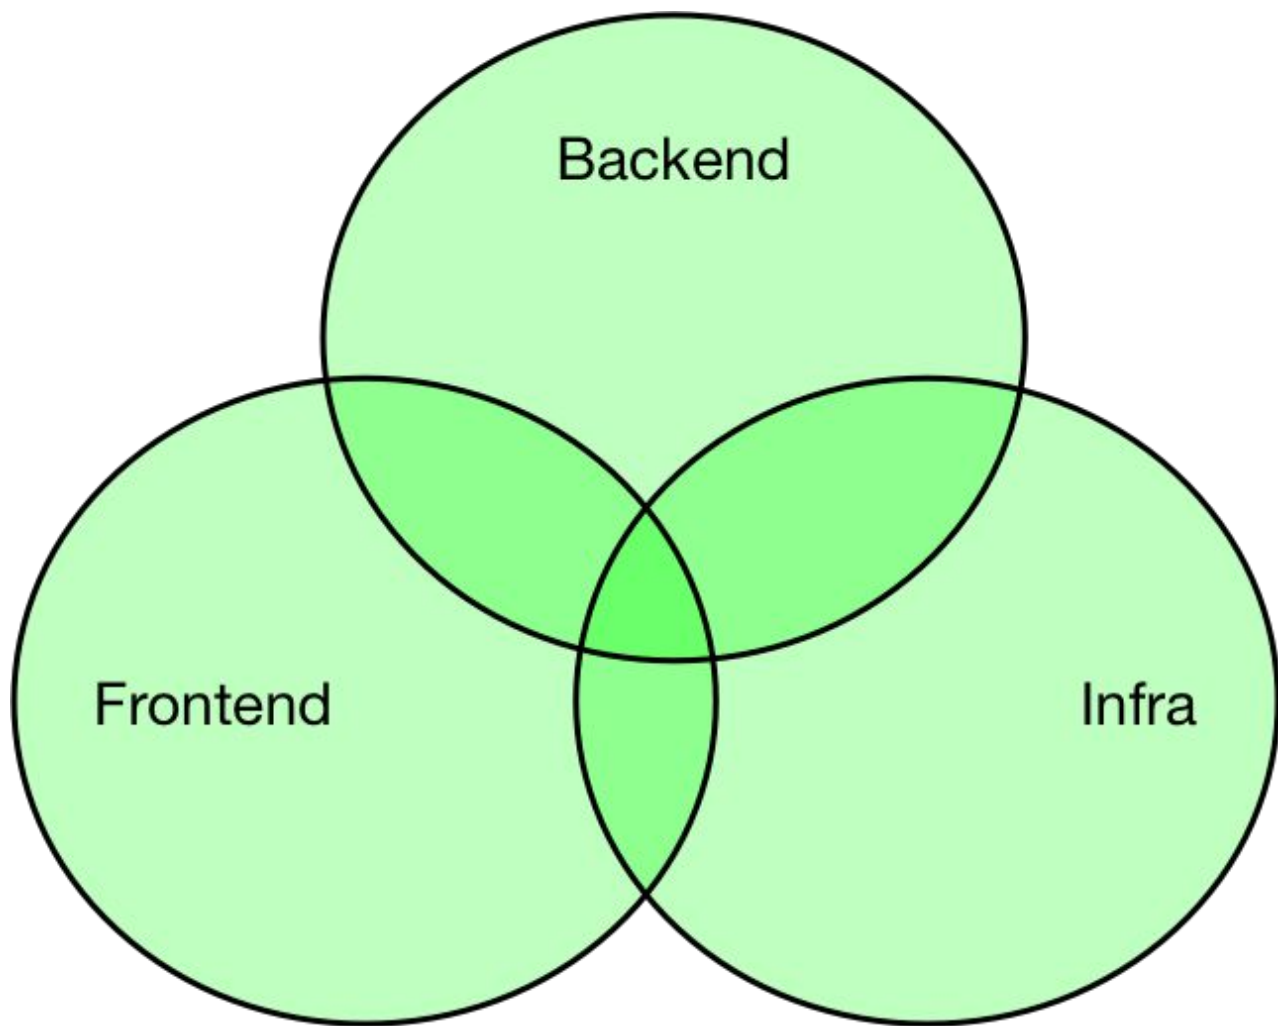

Do migrations matter?

Effective migrations!

Teams bet on migrations.

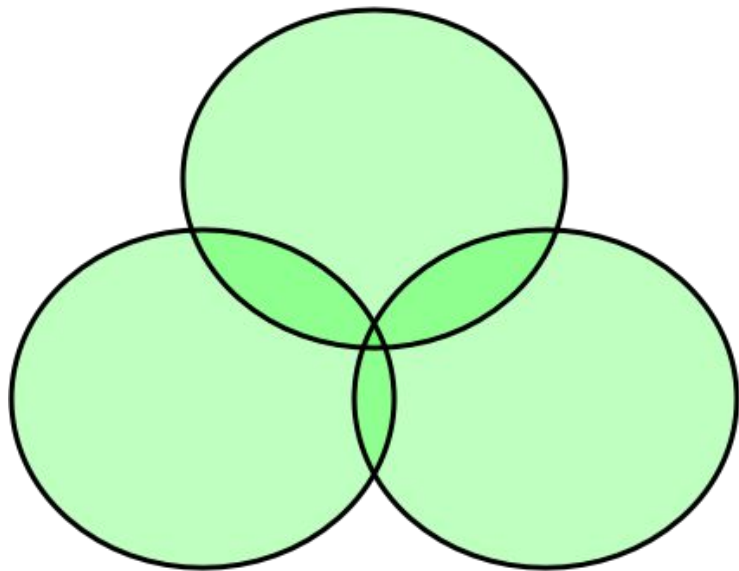

Digg v4.

So... do migrations matter?

Yes.

Quick aside: interfaces!

Strong interfaces

Most implementation
within team scope

Weak interfaces

Most implementation
within shared scope

What is a migration?

Do migrations matter?

Effective migrations!

Every migration is a product.

Effective migrations!

Derisk.

Enable.

Finish.

Place good bets.

1) Is this worth doing?

Find sponsor.

Opportunity cost.

Not invented here.

Not included here.

Hammer looking for a nail.

Hammer is good for a n

2) Will it work?

Design document.

Prototype.

Embed with early adopters.
